How to Order

When you order, indicate MHR230R (D)×(R)×(ℓ1)×(d).

※(γ) is reference value.

MHR230R

MUGEN COATING 2-Flute Long Neck Radius End Mill

Unit : mm

How to Order

When you order, indicate MHR230R (D)×(R)×(ℓ1)×(d). ※(γ) is reference value.

MHR230R

MUGEN COATING 2-Flute Long Neck Radius End Mill

Unit : mm

How to Order

When you order, indicate MHR230R (D)×(R)×(ℓ1)×(d). ※(γ) is reference value.

MHR230R

MUGEN COATING 2-Flute Long Neck Radius End Mill

Unit : mm

## MUGEN COATING 4-Flute Long Neck Radius End Mill

4-flute long neck corner radius end mill. Maximum L/D=12

- Enhanced selectivity for machining process in all 146 sizes.
- Employing short flute length. Less contact to work material reduces chattering.
- Corner R accuracy :  $\pm 5\mu\text{m}$  (Dia.  $\sim 2.5$ )
- Upgraded MUGEN COATING brings outstanding performance for milling of Prehardened Steels and Copper Electrode as well.

## MUGEN COATING 2-Flute Long Taper Neck Radius End Mill

MG 2 30° Corner R  $\pm 0.005$   $\phi d$  h5

Side Slot Face

- Improve surface overall accuracy brought by high speed cutting with minimal chattering in roughing to finishing process.
- High R-Accuracy :  $\pm 5\mu\text{m}$ .
- Better performance in wide range of machining of direct carving on Hardened Steels, Prehardened Steels and Copper Electrode.

| Code No.       | Dia. (D) | Corner Radius (R) | Neck Taper Angle ( $\theta$ ) | Under Neck Length ( $\ell_1$ ) | Neck Dia. ( $d_1$ ) | Length of Cut ( $\ell$ ) | Under Neck Length 2 ( $\ell_2$ ) | Neck Taper Angle 2 ( $\gamma$ ) | Effective Inclined Angle ( $\alpha$ ) | Shank Dia. (d) | Overall Length (L) |

## MUGEN COATING 2-Flute Taper End Mill

The MG logo is shown in a black square. Below it are two icons: 'Side' showing a yellow U-shaped component and 'Slot' showing a yellow rectangular component with a slot.

- MUGEN COATING realizes long tool life at tapered cutting.
- Available from Dia. 0.2 to Dia.10mm and taper angle are from 30' to 20°.

|                               | Notes<br>※1 Use cutting fluid.<br>※2 Adjust spindle speed and feed according to inclined angle.<br>※3 When corner machining, reduce the feed by approximately 50%~30%.<br>※4 Adjust spindle speed and feed at the same rate also reduce depth of cut, if the machine spindle speed insufficient. |        |                                                                                                             |        |                   |        |

## MUGEN COATING 2-Flute Taper Ball End Mill

Line up to maximum neck taper angle  $15^\circ$  of standard type taper ball end mill

- It is possible to cut both taper and ball simultaneously.
- The available sizes are from radius 0.1 and single angles up to 15°.

Unit : mm

| Code No.       | Radius (R) | Taper Angle (θ) | Length of Cut (ℓ) | Dia. at Large End (d1) | Neck Taper Angle (γ) | Shank Dia. (d) | Overall Length (L) |

## How to Order

When you order, indicate MTB230 (R) x (θ).

※( $d_1$ ) and ( $\gamma$ ) is reference value.

| Code No.       | Radius (R) | Taper Angle (θ) | Length of Cut (ℓ) | Dia. at Large End (d1) | Neck Taper Angle (γ) | Shank Dia. (d) | Overall Length (L) |
|----------------|------------|-----------------|-------------------|------------------------|----------------------|----------------|--------------------|
| 08-00540-04504 | R0.45      | 1°              | 4                 | 1.02                   | 9°                   | 4              | 50                 |

MUGEN COATING PREMIUM 4-Flute High Efficient "Z" End Mill for Stainless Steels

Recommended Milling Conditions

For machining on stainless steels and heat resistant alloy  
Continuous machining from plunging to slotting  
Unequal flute spacing and unequal helix angle design

※ Plunge depth is referred to recommended milling conditions

- Unequal flute spacing, unequal helix angle and high rigid end profile design to minimize chatter realize high efficient machining.
- New developed special edge profile realized multi-functional performance of side milling, slot milling and plunging approaches on stainless steel.
- Optimized high heat-resistance MUGEN COATING PREMIUM to realize stable long time machining.
- Total 62 sizes, some sizes line up with L/D=2 or 3.

※ The practical Length of Cut is 0.1mm longer than the specification table.

| Notes                         |                  |     | ※1 Please choose the short end tooth when measure the tool length.<br>※2 Adjust milling condition conforming with machine rigidity and clamping condition.<br>Final milling conditions are subject to machining profile, purpose and machine status.<br>※3 Adjust both Spindle Speed and Feed at the same rate.<br>※4 Water-soluble fluid is recommended.<br>※5 Please increasing the coolant flow rate and pressure as much as possible, and supply it sufficiently to the machining point and flute.<br>※6 Please change the Depth of Cut or Feed when chips could not remove smoothly during plunging.<br>※7 Please be noted there would be a possible tool chipping or breakage when the chip removal is insufficient.<br>※8 Use a rigid and precise machine and chuck holder.<br>※9 Overhang of end mill should be as short as possible from spindle nose. |        |                   |        |                   |        |                                                                                                  |        |                   |        |                   |        |

High efficient machining on carbon steels !  
Continuous machining from plunging approach to slotting

※ Plunge depth is referred to recommended milling conditions

- Unequal flute spacing, unequal helix angle and high rigid end profile design to minimize chatter realize high efficient machining.
- New developed special edge profile realized multi-functional performance of side milling, slot milling and plunging approaches on carbon steels.
- Long time stable machining is realized by adopting MUGEN COATING.
- Total 62 sizes, some sizes line up with L/D=2 or 3.

※ The practical Length of Cut is 0.1mm longer than the specification table.

| Notes                         |                  |     | ※1 Please choose the short end tooth when measure the tool length.<br>※2 Adjust milling condition conforming with machine rigidity and clamping condition.<br>Final milling conditions are subject to machining profile, purpose and machine status.<br>※3 Adjust both Spindle Speed and Feed at the same rate.<br>※4 Please increasing the coolant flow rate and pressure as much as possible, and supply it sufficiently to the machining point and flute.<br>※5 Please change the Depth of Cut or Feed when chips could not remove smoothly during plunging.<br>※6 Please be noted there would be a possible tool chipping or breakage when the chip removal is insufficient.<br>※7 Use a rigid and precise machine and chuck holder.<br>※8 Overhang of end mill should be as short as possible from spindle nose. |        |                                                                                                                           |        |                                                                                                                        |        |                                                                                                                                      |        |                                                                                                                     |        |                                                                                                    |        |                                                                                                                                      |        |                                                                                                                     |        |                                                                                                    |        |

For machining on steels Continuous machining from plunging without guide-hole and stepping to slotting

**PATENTED** PAT. No. 3811129

$D < \phi D$  0  
 $-0.02$   
 $D \geq \phi D$   $-0.015$   
 $-0.035$

- New flute design brought a remarkable shearing ability.
- High efficient machining is realized both for plunge cutting and slotting.

| Notes                         | ※1 Adjust Depth of Cut according to machine rigidity.<br>Final milling conditions are subject to machining profile, purpose and machine status.<br>※2 Adjust both spindle speed and feed at the same rate.<br>※3 Air blow is recommended.<br>※4 Water-insoluble fluid is recommended for cutting stainless steels.<br>※5 Adjust milling condition with caution for chip evacuation and smoke generation when milling with water-insoluble fluid.<br>※6 Step machining is recommended for plunging stainless steels.<br>※7 Chip disposal is important.<br>※8 Use a rigid and precise machine and chuck holder.<br>※9 Overhang of end mill should be as short as possible from spindle nose. |          |          |                 |                         |          |          |                 |                            |          |          |                 |                                        |          |          |                 |

High efficient 3-Flute End Mill for Aluminium L/D=3 ※Listed at “Aluminium Milling” as well (Page L-020)

Recommended Milling Conditions

For machining on aluminium alloy. Continuous machining from plunging without guide-hole and stepping to slotting

- AL-series realized a stable and high efficient machining.
- It exhibits stable excellent surface on a wide area and no chattering occurs even during high speed cutting.
- Realized high efficiency machining by adopting 3 flutes.

MUGEN COATING 4-Flute Long Neck High Efficient "Z" End Mill for Carbon Steels

High efficient machining on carbon steels.  
Continuous machining from plunging approach to slotting.  
Long neck type to prevent interference

※ Plunge depth is referred to recommended milling conditions

- Unequal flute spacing, unequal helix angle and high rigid end profile design to minimize chatter realize high efficient machining.
- New developed special edge profile realized multi-functional performance of side milling, slot milling and plunging approaches on carbon steels.
- Long time stable machining is realized by adopting MUGEN COATING.
- Long neck type prevent interference with work material, the Under neck length lined up with L/D=3 to 5.

| Notes                      |                   |     | ※1 Please choose the short end tooth when measure the tool length.<br>※2 Adjust milling condition conforming with machine rigidity and clamping condition.<br>Final milling conditions are subject to machining profile, purpose and machine status.<br>※3 Adjust both Spindle Speed and Feed at the same rate.<br>※4 Please increasing the coolant flow rate and pressure as much as possible, and supply it sufficiently to the machining point and flute.<br>※5 Please change the Depth of Cut or Feed when chips could not remove smoothly during plunging.<br>※6 Please be noted there would be a possible tool chipping or breakage when the chip removal is insufficient.<br>※7 Use a rigid and precise machine and chuck holder.<br>※8 Overhang of end mill should be as short as possible from spindle nose. |        |                   |        |                   |        |                                                                                                                        |        |                   |        |                   |        |                                                                                                                        |        |                   |        |                   |        |

DLC COATING high efficient 3-Flute End Mill  
for Aluminium L/D=1.5

※Listed at “Aluminium Milling” as well (Page L-028)

Recommended Milling Conditions

For machining on aluminium alloy.  
Continuous machining from plunging without guide-hole and  
stepping to slotting.DLC coating applied for longer tool life

- Aluminium Alloy **N**
- Copper **N**
- Resin **N**

● Adopted NS TOOL original DLC COATING that suitable for  
long time machining.

High efficient 3-Flute End Mill for Aluminium L/D=1.5 ※Listed at “Aluminium Milling” as well (Page L-024)

High efficient 3-Flute End Mill for Aluminium L/D=1.5

For machining on aluminium alloy. Continuous machining from plunging without guide-hole and stepping to slotting

- AL-series realized a stable and high efficient machining.
- Improved plunging capacity!
- High performance with better chip disposal.
- Add new 5D Under neck length type and long shank type to become 124 sizes.

| Notes                         |                         | ※1 Adjust both spindle speed and feed at the same rate.<br>(When using spindle speed 20,000 or more, the same adjustment is required.)<br>※2 TYPE A : Recommended milling conditions for full length of cut type are at overhang 3D. Adjust spindle speed and feed rate at 80% for overhang 5D, and 50% for 7D.<br>※3 Use a rigid and precise machine and chuck holder.<br>※4 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※5 When tending to have chip packing during plunging, step milling is recommended.<br>※6 Water-soluble fluid is recommended. |          |          |                 |                                      |          |          |                 |                        |          |          |                 |

MUGEN COATING PREMIUM Power Radius End Mill

For machining on stainless steels and heat resistant alloy.  
High efficient machining with unequal flute spacing and unequal helix angle  
design to suppress chattering

- Improved designs of unequal helix angle and flute spacing. Suppression from chattering to realize stable milling progression.
- Original spiral design at corner radius flutes improves cutting edge performance!
- Designed for high rigidity to suppress corner radius flute breakage even on rough milling stresses.
- Adopted MUGEN COATING PREMIUM for improvement heat resistance and cutting edge strength to protect from milling heat influence.

# MSX440

Size  $\phi 3 \times R0.2 \sim \phi 20 \times R1$

MUGEN COATING Power Radius End Mill

Unequal helix angle and flute spacing to minimize chattering  
Suitable for steels to stainless steels

- It is very suitable for roughing and semi-finishing on stainless steels and tough materials by unequal flute design.
- High performance for reducing roughing time.
- ▲: The sizes will no longer be on sale after the stock runs out.

2-Flute L/D=2 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium. L/D=2  
Reducing chatter and burr by specialized cutting edge design for aluminium

- AL-series realized a stable and high efficient machining.
- L/D=2 to increase rigidity and realize best cost performance.

DLC COATING 2-Flute L/D=2 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium. L/D=2  
DLC coating applied for longer tool life

● Adopted NS TOOL original DLC COATING that suitable for long time machining.

Coating

- Aluminium Alloy **N**
- Copper **N**
- Resin **N**

2-Flute L/D=3 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium. L/D=3  
Reducing chattering and burr cutting edge design for aluminium

- AL-series realized a stable and high efficient machining.
- It exhibits stable excellent surface on a wide area and no chattering occurs even during high speed cutting.

Unit : mm

| Notes                         | ※ 1 Adjust both spindle speed and feed at the same rate.<br>(When using spindle speed 20,000 or more, the same adjustment is required.)<br>※ 2 Use a rigid and precise machine and chuck holder.<br>※ 3 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※ 4 Water-soluble fluid is recommended. |        |                   |        |                                      |        |                   |        |                        |        |                   |        |

DLC COATING 2-Flute L/D=3 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium. L/D=3  
DLC coating applied for longer tool life

- AL-series realized a stable and high efficient machining.
- Adopted NS TOOL original DLC COATING that suitable for long time machining.

| Notes                      | ※ 1 Adjust both spindle speed and feed at the same rate.<br>(When using spindle speed 20,000 or more, the same adjustment is required.)<br>※ 2 Use a rigid and precise machine and chuck holder.<br>※ 3 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※ 4 Water-soluble fluid is recommended. |        |                   |        |                                      |        |                   |        |                        |        |                   |        |

2-Flute L/D=4 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium. L/D=4  
Reducing chatter and burr by cutting edge design for aluminium

- It exhibits stable excellent surface on a wide area and no chatter occurs even during high speed cutting.

Square

DLC COATING 2-Flute L/D=4 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium.  
L/D=4. DLC coating applied for longer tool life

● Adopted NS TOOL original DLC COATING that suitable for long time machining.

| Notes                          | ※ 1 Adjust both spindle speed and feed at the same rate.<br>(When using spindle speed 20,000 or more, the same adjustment is required.)<br>※ 2 Use a rigid and precise machine and chuck holder.<br>※ 3 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※ 4 Water-soluble fluid is recommended. |        |                                      |        |                        |        |

2-Flute L/D=5 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium. L/D=5  
Reducing chattering and burr by cutting edge design for aluminium

- AL-series realized a stable and high efficient machining.
- It exhibits stable excellent surface on a wide area and no chattering occurs even during high speed cutting.

| Notes                          | ※ 1 Adjust both spindle speed and feed at the same rate.<br>(When using spindle speed 20,000 or more, the same adjustment is required.)<br>※ 2 Use a rigid and precise machine and chuck holder.<br>※ 3 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※ 4 Water-soluble fluid is recommended. |        |                                      |        |                        |        |

DLC COATING 2-Flute L/D=5 End Mill for Aluminium

Recommended Milling Conditions

2-flute end mill for aluminium. L/D=5.  
DLC coating applied for longer tool life

● Adopted NS TOOL original DLC COATING that suitable for long time machining.

| Depth of Cut<br><br>(D: Dia.) | <div>Side Milling</div>                                                                                                                                                                                                                                                                                                                                                                 |        |                                      |        |                        |        |
| Notes                         | ※ 1 Adjust both spindle speed and feed at the same rate.<br>(When using spindle speed 20,000 or more, the same adjustment is required.)<br>※ 2 Use a rigid and precise machine and chuck holder.<br>※ 3 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※ 4 Water-soluble fluid is recommended. |        |                                      |        |                        |        |

High efficient 3-Flute End Mill for Aluminium L/D=3 ※Listed at “High Efficient Milling” as well (Page K-012)

Recommended Milling Conditions

For machining on aluminium alloy. Continuous machining from plunging without guide-hole and stepping to slotting

- AL-series realized a stable and high efficient machining.
- It exhibits stable excellent surface on a wide area and no chattering occurs even during high speed cutting.
- Realized high efficiency machining by adopting 3 flutes.

| Notes                          | ※ 1 Adjust both spindle speed and feed at the same rate.<br>(When using spindle speed 20,000 or more, the same adjustment is required.)<br>※ 2 Use a rigid and precise machine and chuck holder.<br>※ 3 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※ 4 When tending to have chip packing during plunging, step milling is recommended.<br>※ 5 Water-soluble fluid is recommended. |        |                   |        |                   |        |                                   |        |                   |        |                   |        |                     |        |                   |        |                   |        |

3-Flute Long Shank End Mill for Aluminium

Recommended Milling Conditions

3-flute long shank end mill for aluminium for deeper area milling

- Slimmed shank suits side milling.
- Corner-C at flute end effects an accurate side step milling.

Unit : mm

High efficient 3-Flute End Mill for Aluminium L/D=1.5 ※Listed at “High Efficient Milling” as well (Page K-020)

High efficient 3-Flute End Mill for Aluminium L/D=1.5

For machining on aluminium alloy. Continuous machining from plunging without guide-hole and stepping to slotting

- AL-series realized a stable and high efficient machining.
- Improved plunging capacity!
- High performance with better chip disposal.
- Add new 5D Under neck length type and long shank type to become 124 sizes!

- Aluminium Alloy **N**
- Copper **N**
- Resin **N**

How to Order

When you order, indicate ALZ345 (D) [x(ℓ1)]. Indicate (L) for Type A. ※(γ) is reference value.

- I : Semi-standard item, please inquire for price and delivery.

| Notes                  |                   | ※1 Adjust both spindle speed and feed at the same rate. (When using spindle speed 20,000 or more, the same adjustment is required.)<br>※2 TYPE A : Recommended milling conditions for standard type are at overhang 3D. Adjust spindle speed and feed rate at 80% for overhang 5D, and 50% for 7D.<br>※3 Use a rigid and precise machine and chuck holder.<br>※4 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.<br>※5 When tending to have chip packing during plunging, step milling is recommended.<br>※6 Water-soluble fluid is recommended. |          |          |              |                                   |          |          |              |                     |          |          |              |

| Notes                         |                         | <div>※1 Adjust both spindle speed and feed at the same rate.<br/>(When using spindle speed 20,000 or more, the same adjustment is required.)</div> <div>※2 TYPE A : Recommended milling conditions for standard type are at overhang 3D. Adjust spindle speed and feed rate at 80% for overhang 5D, and 50% for 7D.</div> <div>※3 Use a rigid and precise machine and chuck holder.</div> <div>※4 Adjust milling conditions when vibration and abnormal sounds occur by the conditions of the machine, chuck holder and work clamping.</div> <div>※5 When tending to have chip packing during plunging, step milling is recommended.</div> <div>※6 Water-soluble fluid is recommended.</div> |          |          |                 |                                      |          |          |                 |                        |          |          |                 |

DLC COATING high efficient 3-Flute End Mill for Aluminium L/D=1.5 ※Listed at “High Efficient Milling” as well (Page K-018)

Recommended Milling Conditions

For machining on aluminium alloy. Continuous machining from plunging without guide-hole and stepping to slotting

● Adopted NS TOOL original DLC COATING that suitable for long time machining.

How to Order

When you order, indicate ALZ345-DLC.    ※(γ) is reference value.

Ball End Mill for Aluminium

Recommended Milling Conditions

Ball end mill for aluminium.  
Reducing chatterting even for milling at corner and curved surface

● NS TOOL unique flute design reduces chatterting at corner and side milling.

Copper Electrode Milling

Long neck square end mill specialized for machining copper alloy  
Sharpe cutting edge makes less burr and high quality surface

$D \leq 1 \phi D \begin{matrix} 0 \\ -0.006 \end{matrix}$   
 $1 < D < 6 \phi D \begin{matrix} 0 \\ -0.01 \end{matrix}$   
 $D = 6 \phi D \begin{matrix} 0 \\ -0.01 \\ -0.02 \end{matrix}$

- Long neck square end mill specialized for machining copper electrode.
- Helix angle 37.5 degrees to achieve both sharpness and finished surface quality that prevents scratches on cutting surface.
- High quality and stable milling performance with long tool life by optimized design and DLC COATING.
- Machining copper tungsten electrodes is also effective.

| Notes         |                   |     | ※1 Recommend to use the milling condition as just reference. Adjust milling conditions according to machining shape and machine status.<br>※2 Depth of Cut : ap=Axial Depth of Cut / ae=Radial Depth of Cut.<br>※3 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※4 Water-insoluble fluid is recommended. |        |              |       |                   |        |              |                              |        |              |       |                   |        |              |

## Long Neck Ball End Mill for Copper Electrode

- Long neck ball end mill specialized for machining copper electrode.
- Sharp edge shearing ability and DLC coating realized high quality and stable a long life machining.
- Machining copper tungsten electrodes is also effective.

| Notes         |                   |      | ※1 These recommended cutting conditions indicate just reference. It should be adjusted according to milling shape and machine type.<br>※2 Depth of Cut : ap=Axial Depth of Cut / ae=Radial Depth of Cut.<br>※3 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※4 Water-insoluble fluid is recommended. |       |        |                   |                                |       |        |                   |

Long neck corner radius end mill specialized for machining copper alloy  
Sharpe cutting edge makes less burr and high quality surface

- Long neck radius end mill specialized for machining copper electrode.
- 37.5°helix angle provides both sharpness shearing ability and finishing surface quality, combining the most suitable cutting edge design realizes the higher quality of finishing surface.
- High quality and stable milling performance with long tool life by optimized design and DLC COATING.
- Machining copper tungsten electrodes is also effective.

| Notes         |               |                   |       | ※1 Recommend to use the milling condition as just reference. Adjust milling conditions according to machining shape and machine status.<br>※2 Depth of Cut : ap=Axial Depth of Cut / ae=Radial Depth of Cut.<br>※3 Recommend to apply helical or ramping for approaching into axial direction.<br>※4 For slotting, recommend reciprocating milling by adjusting feed & ap in below 60% of recommended milling condition.<br>※5 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※6 Water-insoluble fluid is recommended. |        |              |       |                              |        |              |       |

Resin Milling

High machinability sharp cutting edge suppresses burrs and enables good finished surface

Size  $\phi$  0.1 ~  $\phi$  6

Short Flute End Mill for Resin

Square end mill for resin. High rigidity with short length of cut

- Applicable to nonferrous material such as Aluminium and Copper.
- Eliminate the conventional problem of the long flute length.

| Unit : mm      |          |                   |                                     |      |                             |                      |                |                    |

Size  $\phi$  0.1 ~  $\phi$  6

End Mill for Resin

Square end mill for resin.  
Maximum L/D=10 for standard type, maximum L/D=35 for long neck type

- Available for the suitable L/D (3D, 5D and 10D) Length of cut with Extra Long Neck or without Under Neck Length!
- Applicable to nonferrous material such as Aluminium and Copper.
- Total 135 size!

Ball End Mill for Resin

Ball End Mill for Resin

Ball end mill for resin.  
Maximum L/D=10 for standard type, maximum L/D=35 for long neck type

- Select the right one for your job, 3D or 5D or 10D Length of cut, with Extra Long-neck or without Under neck length.
- Applicable to nonferrous material such as Aluminium and copper.

Unit : mm

| Code No.       | Radius (R) | Length of Cut (ℓ) | Underneck Length (ℓ <sub>1</sub> ) | Type | Dia. (D) | Neck Taper Angle (γ) | Neck Dia. (d <sub>2</sub> ) | Shank Dia. (d) | Overall Length (L) |

How to Order

When you order, indicate RSB230 (R)×(ℓ) [×(ℓ<sub>1</sub>)]. Choose Shank Dia. (d) for typeA of R1.5×9ℓ and R2×12ℓ.  
※(γ) is reference value.

Unit : mm

| Code No.       | Radius (R) | Length of Cut (ℓ) | Underneck Length (ℓ <sub>1</sub> ) | Type | Dia. (D) | Neck Taper Angle (γ) | Neck Dia. (d <sub>2</sub> ) | Shank Dia. (d) | Overall Length (L) |

|               |               | 80                | 13.3 | 1,600                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 650    | 0.28         | 1,600                  | 540    | 0.28         | 1,600             | 430    | 0.28         |
| Notes         |               |                   |      | ※1 These recommended cutting conditions indicate just reference for roughing. It should be adjusted according to milling shape and machine type.<br>※2 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※3 For finishing process, please adjust to the optimized condition to meet the requirement of machining accuracy.<br>※4 Necessary to adjust the cutting condition at the parts overloading against the tools such as inner corner parts.<br>※5 Adjust both spindle speed and feed at the same rate when chattering or abnormal sounds occurred.<br>※6 When a tool with L/D 10 times and longer deflects on milling, please reduce Feed or Depth of Cut.<br>※7 For a tool with L/D longer than 20 times, reduce spindle speed, feed rate and depth of cut at sufficient values by referring the cutting conditions of L/D 20 times.<br>※8 Air blow is recommended.<br>※9 Care for chip removal to avoid being stuck or caught during process for better surface quality.<br>※10 Minimize chucking runout. |        |              |                        |        |              |                   |        |              |

Ball End Mill for Hard Brittle Material

Recommended Milling Conditions

Ball end mill for direct milling on cemented carbide, ceramic and glass

- Spiral ball shape with balanced strength and sharpness of cutting edges adopted newly-developed DIAMOND COATING with enhanced sticking force.

[Neck Profile]

Reference value of interference angle after length of cut is 12°. Actual measurement required, in order to avoid interference between tool and work material.

How to Order

When you order, indicate DCMB (R) [×(ℓ<sub>1</sub>)].

Machining Case 1

Work Material : Cemented Carbide (89HRA)

Tool size : DCMB R1

Work size : 20×20×10mm

Finishing

|                |                         |
|----------------|-------------------------|
| Spindle speed  | 20,000min <sup>-1</sup> |
| Feed           | 200mm/min               |
| Depth of cut   | 0.005mm×0.01mm (ap×ae)  |
| Machining time | 3hr 55min               |
| Coolant        | Oil mist                |

Surface roughness (R<sub>z</sub>) : 0.51 μm~1.04 μm

## DIAMOND COATING 2-Flute End Mill

## Recommended Milling Conditions

2-flute with helix angle 35° end mill applied diamond coating  
suitable for graphite, composite material

- Original DIAMOND COATING realized a long tool life for the machining of graphite, silicon-aluminum alloy and brittle materials.
- Square design of L/D=3 is suited for the machining of narrow and deep area.

|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notes | <p>※1 Graphite should be machined by the machining center designed for graphite machining.<br/>When handling with graphite material, dust collector and respirator are recommended to protect against graphite dust.</p> <p>※2 Air blow cooling is recommended for the machining of graphite.</p> <p>※3 Slow down the feed for high accurate machining to avoid breakage of work piece.</p> <p>※4 Adjust both spindle speed and feed at the same rate when chattering.</p> |

DIAMOND COATING 2-Flute Long Neck End Mill

Recommended Milling Conditions

Long neck square end mill with diamond coating suitable for graphite and composite material

- Original DIAMOND COATING realized a long tool life for the machining of graphite, silicon-aluminium alloy and brittle materials.
- Long neck design is suited for the machining of narrow and deep area.

Unit : mm

| Notes         |                   | ※1 Graphite should be machined by the machining center designed for graphite machining.                               |        |              |          |                   |        |              |                             |        |              |               |                   |              |          |
|               |                   | When handling with graphite material, dust collector and respirator are recommended to protect against graphite dust. |        |              |          |                   |        |              |                             |        |              |               |                   |              |          |
|               |                   | ※2 Air blow cooling is recommended for the machining of graphite.                                                     |        |              |          |                   |        |              |                             |        |              |               |                   |              |          |
|               |                   | ※3 Slow down the feed for high accurate machining to avoid breakage of work piece.                                    |        |              |          |                   |        |              |                             |        |              |               |                   |              |          |
|               |                   | ※4 Adjust both spindle speed and feed at the same rate when chattering.                                               |        |              |          |                   |        |              |                             |        |              |               |                   |              |          |

DIAMOND COATING 2-Flute Long Neck Ball End Mill

Recommended Milling Conditions

Long neck ball end mill with diamond coating suitable for graphite and composite material

- Original DIAMOND COATING realized a long tool life for the machining of graphite, silicon-aluminium alloy and brittle materials.
- Long neck design is suited for the machining of narrow and deep area.

Unit : mm

| Notes         |                   | ※1 Graphite should be machined by the machining center designed for graphite machining.<br>When handling with graphite material, dust collector and respirator are recommended to protect against graphite dust.<br>※2 Air blow cooling is recommended for the machining of graphite.<br>※3 Reduce the feed for high accurate machining and to avoid breakage of work piece.<br>※4 Adjust both spindle speed and feed at the same rate when chattering. |        |                   |                   |                             |        |                   |                   |

Notes

※1 Recommend drilling depth is 2D.

※2 Coolant must supply correctly to the point of drilling or flute.

※3 Adjust drilling condition conforming to machine rigidity, holder rigidity and clamping condition.

※4 Refer below table for recommended drilling condition in case of drilling on curved surface, inclined surface or semicircular hole.

※5 Minimize chucking runout.

※6 When chip can not be disposed, apply step feed.

※7 Water soluble fluid is recommended.

Recommended Drilling Conditions Depending on Work Shape

| Slope<br>(Inclination angle 30° lower) |      | Slope<br>(Inclination angle 30° over) |               | Curved Surface |        | Semicircular Hole |          |               |      |
|----------------------------------------|------|---------------------------------------|---------------|----------------|--------|-------------------|----------|---------------|------|

## MUGEN MICRO COATING Micro Drill Short

## Recommended Milling Conditions

Coated micro drill Dia.0.1mm or smaller to drill hole depth L/D=6

- L/D=6 short type.
- Special thin film coating for Micro Drill exercise high drilling performance on steels include stainless steels.
- Thinning on the cutting edge to reduce cutting load for accurate drilling. (Dia. 0.02~)

| Notes         | ※1 Use appropriate coolant for work material and machining description.<br>※2 Minimize chucking runout by setting spindle speed at minimum oscillation.<br>(Recommend to measure actual runout at activated Spindle Speed.)<br>※3 Set up flat surface before start machining.<br>※4 Take extra care when chucking in and out. |        |           |                          |        |           |

Micro drill Dia.0.1mm or smaller to drill hole depth L/D=10

NSMD  $\phi$ 0.01

Thinning

- Standardized from dia. 0.01mm by concentrating NS manufacturing technology!
- Micro Drill develops new drilling capability.
- Thinning on the cutting edge to reduce cutting load for accurate drilling.(Dia. 0.02~)
- L/D=10 standard type.

For making a guide hole for micro drill

- Micro Point Drill for guide hole.
- Thinning on the cutting edge to reduce cutting load for accurate drilling. (Dia. 0.025~)

| Notes         | ※1 Use appropriate coolant for work material and machining description.<br>※2 Minimize chucking runout by setting spindle speed at minimum oscillation.<br>(Recommend to measure actual runout at activated Spindle Speed.)<br>※3 Set up flat surface before start machining.<br>※4 Take extra care when chucking in and out. |        |           |                      |        |           |                                     |        |           |                       |        |           |                         |        |           |

## Recommended Milling Conditions

When you order, indicate MSDH (D). ※(γ) is reference value.

A bar chart comparing the number of holes between two categories: Sustainable and Breakage. The y-axis is labeled 'Number of holes' and ranges from 0 to 1,200 in increments of 200. The Sustainable bar is orange and reaches 1,000. The Breakage bar is green and reaches 681. The x-axis labels are 'MSDH' and 'Competitor'.

| Category    | Number of holes |
|-------------|-----------------|
| Sustainable | 1,000           |
| Breakage    | 681             |

|                 |                          |

MG 4 6 ød h5 Thread

Cutting edge shape  
4-Flute

Cutting edge shape  
6-Flute

Unit : mm

- Improvement of cutting accuracy by adoption of tool design focusing on sharpness.
- MUGEN COATING realized long tool life.
- When the tool is broken during thread milling, the wreckage can be easily removed as the tool diameter is smaller than the pilot hole.

※ This Product should be used in the forward rotation.

## How to Order

When you order, indicate MMTM Thread Size. ※(γ) is reference value.

## Machining case

W-029

## Notes

- ※1 This Product should be used in the forward rotation.
- ※2 Software for generating NC program Will be provided on NS web site.
- ※3 The above Recommended Milling Conditions is provided as a guide for cutting when the depth of cut is divided into twice with water-soluble fluid.
- ※4 Recommend making pilot hole in advance by using drill, etc.
- ※5 Depending on environment, adjustments of spindle speed based on feed per tooth, feed, number of paths and cutting direction are needed.
- ※6 Helical R, 5H for M1.4 and under and 6H for more than M1.6, is a guideline for thread milling and it is R value in the final cutting.
- ※7 When use helical R in the Recommended Milling Conditions, set pilot hole dia. for avoiding interference between the area of under neck and pilot hole.
- ※8 Add zero-cut process in case completed thread left deflection angle.
- ※9 Choose appropriate coolant for each working material.

NC programming software is available on our website.

Thread

● World smallest threaded size 0.1mm is possible to cut.

● When the tool is broken during thread milling, the wreckages can be easily removed as the tool diameter is smaller than the pilot hole.

● MUGEN COATING realized long tool life.

How to Order

When you order, indicate MMTS Thread Sizex ( ℓ1 ).

● S0.1 and S0.2 are original standard by NS Tool Co., LTD. as a miniature thread standard of JIS is from S0.3.

NC programming software is available on our website.

Notes

※ 1 This Product should be used in the forward rotation.  
※ 2 Radial depth of cut may be divided into multiple cutting approaches by condition of spindle runout and machine.  
※ 3 Radial depth of cut must be divided into multiple cutting approaches for the sizes, S0.1, S0.2, and S0.3.  
※ 4 Adjust process helical final value based on measured actual Dia. of the tool if possible.  
※ 5 Care differences of actual pilot hole Dia. caused by runout of a pilot drill and rotation.  
※ 6 Process Helical is a circular radius value of actual tool movement when helical process by MMTS.  
※ 7 Add zero-cut process in case completed thread left deflection angle.  
※ 8 Tool overhang to be as short as possible.  
※ 9 Extra care of handling when tool setting and measuring.  
※ 10 Choose appropriate coolant for each working material.  
※ 11 Care with cutting chip removal.

MUGEN COATING 2-Flute Inner Radius Cutter

Recommended Milling Conditions

TYPE A

TYPE B

It is suitable for both machining NC and MC and can be cut at the corner radius easily.

Tool life is exceptionally extended as MUGEN COATING provides additional wear resistance.

| Code No.       | Radius (R) | Dia. (D) | Outer Dia. (d1) | Outer Dia. Length (ℓ1) | Neck Taper Angle (γ) | Type | Shank Dia. (d) | Overall Length (L) |

S-005

Chamfer Cutter

Recommended Milling Conditions

Specialized for cutting at chamfering.  
Sharp edge with high rake angle realizes good surface quality and reduces burr.  
For non-ferrous metal

● It can be cut at the corner easily.

Unit : mm

| Code No.       | Dia.<br>(D) | Taper Angle<br>( $\theta$ ) | Length of Cut<br>( $\ell$ ) | Shank Dia.<br>(d) | Overall Length<br>(L) |
|----------------|-------------|-----------------------------|-----------------------------|-------------------|-----------------------|
| 04-00250-00400 | 4           | 45°                         | 2                           | 4                 | 60                    |
| 04-00250-00600 | 6           | 45°                         | 3                           | 6                 | 70                    |

How to Order When you order, indicate NSCV (D).

Precaution for use

Enlargement of the tip section

Unit : mm

| Dia. | $\alpha$ | $\beta$ | ( $\phi$ D1) |
|------|----------|---------|--------------|
| 4    | 0.15     | 0.06    | 0.42         |
| 6    | 0.45     | 0.15    | 1.2          |

※ Required adjustments of the cut points to avoid using  $\alpha$  part because its tool tip has no cutting edges.  
※ Because the tool tip  $\alpha$  part of point angle is not 90°, the value of  $\beta$  must be offset in the ap direction during machining on virtual tip basis.  
In case of no adjustments, it requires attention because chamfer will be bigger than targeted value.

| Dia.         | Aluminium Alloy<br>A5052                                                                                                                                                                                                                                                                                      |        |

|              | min <sup>-1</sup>                                                                                                                                                                                                                                                                                             | mm/min |
| 4            | 11,000                                                                                                                                                                                                                                                                                                        | 2,400  |
| 6            | 7,500                                                                                                                                                                                                                                                                                                         | 1,800  |
| Depth of Cut |                                                                                                                                                                                                                            |        |
| Notes        | ※ 1 The above milling conditions are the value of reference for 4D, it needs adjustments of the conditions when it is longer.<br>※ 2 Adjust both spindle speed and feed at the same rate.<br>※ 3 Machine, tool chuck must be sufficiently rigid.<br>※ 4 Choose appropriate coolant for each working material. |        |

MUGEN COATING Chamfer Cutter

Recommended Milling Conditions

Specialized for cutting at chamfering.  
Sharp edge with high rake angle realizes good surface quality and reduces burr.  
For steel

- It can be cut at the corner easily.
- Tool life is exceptionally as MUGEN COATING provides additional wear resistance.

Unit : mm

| Code No.       | Dia.<br>(D) | Taper Angle<br>( $\theta$ ) | Length of Cut<br>( $\ell$ ) | Shank Dia.<br>(d) | Overall Length<br>(L) |
|----------------|-------------|-----------------------------|-----------------------------|-------------------|-----------------------|

| Depth of Cut |                                                                                                                                                                                                                            |        |                            |        |                               |        |
| Notes        | ※ 1 The above milling conditions are the value of reference for 4D, it needs adjustments of the conditions when it is longer.<br>※ 2 Adjust both spindle speed and feed at the same rate.<br>※ 3 Machine, tool chuck must be sufficiently rigid.<br>※ 4 Choose appropriate coolant for each working material. |        |                            |        |                               |        |

Precaution for use

Enlargement of the tip section

Unit : mm

| Dia. | $\alpha$ | $\beta$ | ( $\phi$ D1) |
|------|----------|---------|--------------|
| 4    | 0.15     | 0.06    | 0.42         |
| 6    | 0.45     | 0.15    | 1.2          |

※ Required adjustments of the cut points to avoid using  $\alpha$  part because its tool tip has no cutting edges.  
※ Because the tool tip  $\alpha$  part of point angle is not 90°, the value of  $\beta$  must be offset in the ap direction during machining on virtual tip basis.  
In case of no adjustments, it requires attention because chamfer will be bigger than targeted value.

How to Order

When you order, indicate NHB-2 (R)×(ℓ<sub>1</sub>). ※(γ) is reference value.

Unit : mm

| Code No.           | Radius (R) | Under Neck Length (ℓ <sub>1</sub> ) | Length of Cut (ℓ) | Dia. (D) | Neck Dia. (d <sub>2</sub> ) | Neck Taper Angle (γ) | Shank Dia. (d) | Overall Length (L) |

Monocrystalline Diamond End Mill “CLEAR EDGE”

- Direct machining to cemented carbide.
- Enable high-accurate machining to brittle materials.
- Unique design to maximize performance of monocrystalline diamond.

Work Material

How to Order

When you order, indicate CED100 (D).

※(γ) is reference value.

Machining Case 1

Work Material: Cemented Carbide (95HRA) Tool size :  $\phi$  0.1

Work size :  $\phi$  10mm Cutting depth : 0.03mm

Surface roughness (Rz) : 1μm

|                |                         |
|----------------|-------------------------|
| Spindle speed  | 12,000min <sup>-1</sup> |
| Feed           | 6mm/min                 |
| Depth of cut   | 0.002mm×0.03mm (ap×ae)  |
| Cutting length | 2.7m                    |
| Machining time | 7hr 30min               |
| Coolant        | Oil mist                |

Machining Case 2

Work Material: Quartz glass Tool size :  $\phi$  0.3

Work size : 75×25×1mm Cutting depth : 0.05mm

Surface roughness (Rz) : 2μm

|                |                         |
|----------------|-------------------------|
| Spindle speed  | 40,000min <sup>-1</sup> |
| Feed           | 15mm/min                |
| Depth of cut   | 0.001mm ap              |
| Cutting length | 3.2m                    |
| Machining time | 4hr                     |
| Coolant        | Oil mist                |

Machining Case 3

Work Material: Mono crystalline silicon Tool size :  $\phi$  0.5

Work size : 45×20×0.7mm

Surface roughness (Rz) : 1.4μm

|                |                          |
|----------------|--------------------------|
| Spindle speed  | 20,000min <sup>-1</sup>  |
| Feed           | 100mm/min                |
| Depth of cut   | 0.0025mm×0.125mm (ap×ae) |
| Cutting length | 21.2m                    |
| Machining time | 3hr 30min                |
| Coolant        | Oil mist                 |

Measuring instrument : KEYENCE: VK9500

- Electro-conductive tool presetter can not be used due to characteristic of the diamond.
- Machining by use of outer flute is not recommended.
- CLEAR EDGE is under lisence production.

Machining Case 4

Work Material: No-electrolytic NiS-plated layer Tool size :  $\phi$  0.1

Work size : 30×10mm

Bottom Surface roughness (Rz) : 1μm

|                |                         |
|----------------|-------------------------|
| Spindle speed  | 12,000min <sup>-1</sup> |
| Feed           | 200mm/min               |
| Depth of cut   | 0.003mm×0.1mm (ap×ae)   |
| Cutting length | 5.5m                    |
| Machining time | 5hr                     |
| Coolant        | Oil mist                |

## Features of NS TOOL

Features of NS TOOL

PAGE

V-002

## Being particular manufacturing that continues to maintain stable accuracy and quality

What is important in NS TOOL's product manufacturing is not only the high quality, but also the absolute quality of always maintaining the high quality and continuing to deliver the same high-precision products.

In- house development tool grinder TGM

Realize stable production accuracy

## Uncompromising on shank accuracy as the basis of the tools

The end mill shank is the part that is attached to the machine tool both when using the end mill and when manufacturing the end mill. The shank is the standard for end mills and is a very important part of the basis of high precision. NS TOOL is particular about the accuracy of the shank, which is the standard, and manufactures it in the 2  $\mu$ m range of "-0.001 mm to -0.003 mm". (Excludes some products.)

## Inspections in each process

### Support micro precision machining with NS TOOL accuracy and quality

NS TOOL inspects end mills in each process to ensure high quality, and find out any occurred abnormalities at early process by inspective system

## Responsibility for stable supply

End mills have become indispensable for cutting, and we are working on various earthquake countermeasures so that supply will not be interrupted. In addition to the measures for buildings mentioned above, we also take thorough measures to prevent falls, prevent glass from scattering, and protect measuring instruments and production equipment. As one of them, we also develop our own seismic detector device. We aim to be the most disaster-resistant factory in the world without stopping the production of our customers.

## Strengths for small diameter sizes under 6mm

### The accuracy and quality of NS TOOL's end mills support micro and precision machining

NS TOOL, which delivers small-diameter end mills to customers, is responsible for product stability. The in-house developed tool grinding machine TGM, which was developed to realize that desire, has made it possible to suppress product variations and deliver products with stable accuracy and quality to customers every time.

## R&D center with the most advanced environment and equipment

Development of new products and technologies that embody customer needs by adopting "all-round seismic isolation" that combines micro-vibration dampers with seismic isolation devices, which are devices that dampen micro-vibrations that hinder microfabrication. We are accelerating. In addition, we have set up a seminar room that can accommodate 150 people, and actively hold seminars by inviting customers, aiming to be a base for disseminating information on precision and microfabrication technology.

### Be aware of the technology to "use" as well as "make"

At our company, we are always conscious of the user's perspective on how it will be used by our customers, and we are working on technological development not only for "making" but also for "using".

We are conscious of developing things not yet in the world from the perspective of being used.

We will keep to continue to be bold with any challenge for development while looking a little ahead of the customer's perspective.

### Tool development realizes micro and precision machining

NS TOOL's great strength is that other companies cannot imitate the manufacturing technology for small diameter sizes, such as standardizing end mills that are thinner than hair and have an outer diameter of 0.01 mm. In particular, the requirements for tolerances have become even more stringent when the diameter is small, and we are currently achieving a tolerance range of 0.004 mm for non-coated products with an outer diameter, ball radius, and corner radius.

### Development of CAD / CAM specialized for fine and precision machining

Tool paths are a very important factor in researching precision and micro fabrication technology. While researching a tool path that allows end mills with a small diameter to fully demonstrate their capabilities, we have also developed a CAD / CAM "NS-Micro CAM".

## NS TOOL Tool Material Introduction

### ■ CBN End Mill

CBN(Cubic Boron Nitride) sintered alloy is 3 times harder than Tungsten carbide, second hardest material next to diamond, moreover strong heat-resistant and high thermal conductivity. However less tough characteristic of CBN often causes chipping of tool edge easily. Accordingly, CBN is recommended for finishing of hard materials with less cutting load on the tool edge, which guarantees extra long tool life.

### ■ PCD End Mill

PCD consists micron-size artificial diamond powders sintered with binding materials such as Co and etc. at high pressure and temperature. PCD is as hard as Monocrystalline Diamond featuring strong wear-resistance. However the use is limited as being fragile against heat. It is mostly used for the machining of brittle materials.

### ■ Cemented Carbide End Mill

Cemented Carbide End Mill is made by WC (Tungsten carbide) -based sintered metal composed with power materials of Co (Cobalt) and etc. Its hardness higher than HSS (High speed steel) takes advantage on wear-resistance. It is widely used for the machining of various materials from Roughing to Finishing.

### ■ Monocrystalline Diamond End Mill

Monocrystalline Diamond End Mill by the hardest material on earth is made by a single crystal on flute unlike PCD consisting various binding materials. Its perfect sharp edge allows milling stress at minimum, while its application range may be limited due to behavior gap of flute wearing against material types. It is mostly used for the machining of brittle materials and non-ferrous metals.

### MUGEN COATING PREMIUM Plus

MUGEN COATING PREMIUM Plus realizes machining on high hardened steels up to 70HRC. Three layers, oxidation resistant layer, hard coating layer (ultra micro crystal structure), and high adhesion coating layer (micro crystal structure), support excellent tool life.

### MUGEN COATING PREMIUM

MUGEN COATING PREMIUM supports the tool life when directly milling on high hardened steels. Suitable for machining on high hardened materials from 48HRC to 65HRC.

### MUGEN COATING

MUGEN COATING is a TiAlN (titanium aluminide) based coating, but it also has strong wear resistance and lubricity against hardened steel, heat-treated steel, raw materials, and copper.

### DLC COATING

DLC (diamond-like carbon) COATING is a carbon film with diamond-like properties and is an amorphous (non-crystalline) structure coating that has both diamond and graphite. The hardness is high, the coefficient of friction is low, and the surface roughness of the film is Ra 0.02 μm, which is extremely smooth. In addition, it has excellent welding resistance, so it is possible to maintain a good finished surface by processing aluminium alloys.

### DIAMOND COATING

High stability is achieved by excellent wear resistance and high adhesion technology made of high-purity diamond that does not contain binders and impurities.

### MUGEN MICRO COATING

This is a TiAlN (titanium aluminide) -based coating developed as a special coating for ultra-small diameter sizes with an outer diameter of 0.1 mm or less, which NS TOOL specializes in.

### X COATING \*Distributor Stock Only

X COATING is based on TiCN (Titanium Carbon Nitride) with high hardness and strong adhesion. It has good performance in general cutting (cutting speed 100 m / min or less) by wet coolant.

## MUGEN COATING PREMIUM Plus

New developed coating with high oxidation resistance and abrasion resistance realizes machining on high hardened steels up to 70HRC. Three layers, Oxidation resistant layer, Hard coating layer (Ultra micro crystal structure), and High adhesion coating layer (micro crystal structure), support excellent tool life.

**SMB120**

R0.01 ~ R0.05 Total 7 sizes

Micro manufacturing cutting into high hardened steels  
Long tool life CBN enables making of highly accurate corners even with a small diameter

Work size 0.31 × 0.28 mm  
(Cutting depth 0.01 mm)

Work material PD613 (60HRC)

Coolant Oil mist

Total machining time 3 hr 10 min

Bottom surface roughness  
Rz 0.80 μm

**MHRH430R** φ 0.1 × R 0.01 ~ φ 6 × R 1 Total 336 sizes

High-precision milling with minimal tool wear even after long hours of machining on high-hardened steel of 60 HRC or higher

Work size 90 × 20 mm  
(Cutting depth 0.35mm)  
Work material HPM31(60HRC)  
Coolant Oil mist  
Total machining time 3 hr 59 min

|                     | Target                     | Actual    |

# What is End mill ?

## What is Cutting tool?

Cutting tools generally include milling tools, end mills, cutters and drills, turning tools, drilling tools, gear hob cutters and etc.

Drilling

Turning processing

Gear processing

## What is end mill?

End mill is similar to drill that supports variety of cutting processes, and is used to produce many industrial products. The biggest dimension is up to about  $\phi 30\text{mm}$ . Recently, with the development of Japanese industrial products, the small diameter end mill that under  $\phi 6\text{mm}$  is becoming popular. Furthermore, the materials of end mill are getting various from high speed steel to cemented carbide, ceramics, and even CBN, PCD brazed on cemented carbide.

# Differences on number of flute

## Number of flute

It is important to choose the number of flute of the end mill according to the usage. Introduction of the advantages, disadvantages, and usage of each number of flute are as below.

| Usage    |              | For General use                                                                     | Slotting & Side milling                                                             | Side milling                                                                        | Side milling                                                                        |

## Rake angle at peripheral cutting edge

Variety of rake angles to support different cutting materials.

End mill with positive rake angle has a sharp flute that generally compatible with nonferrous metals and low hard materials. On the other hand, the negative rake angle has strong cutting edge to support high hard materials machining.

# Cutting conditions of End Mill (1)

## Calculation for Cutting Speed, Spindle Speed and Feed

|                                        |                                         |                                                                                |
|----------------------------------------|-----------------------------------------|--------------------------------------------------------------------------------|
| Cutting Speed $vc$ (m/min)             | $= \frac{\pi \times D \times n}{1,000}$ | $n$ = Spindle Speed<br>$D$ = End mill diameter<br>$\pi$ = Circle ratio (3.14)  |
| Spindle Speed $n$ (min <sup>-1</sup> ) | $= vc \div \pi \div D \times 1,000$     | $vc$ = Cutting Speed<br>$\pi$ = Circle ratio (3.14)<br>$D$ = End mill diameter |
| Feed $vf$ (mm/min)                     | $= n \times fz \times Z$                | $n$ = Spindle Speed<br>$fz$ = feed per tooth<br>$Z$ = number of flute          |
| Feed per Tooth $fz$ (mm/tooth)         | $= \frac{vf}{n \times Z}$               | $vf$ = Feed<br>$n$ = Spindle Speed<br>$Z$ = number of tooth                    |

When maximum speed of the machine spindle less than value of recommended milling conditions, adjust conditions by calculation as follows.

- Rate ( $\alpha$ ) is calculated by chosen Spindle Speed ( $n$ ) and Recommended Spindle Speed ( $n1$ ).

$$n \text{ (min}^{-1}\text{)} \div n1 \text{ (min}^{-1}\text{)} = \alpha$$

Rate

- Obtain Feed ( $vf$ ) for actual machining by multiplying. Recommended Feed ( $vf1$ ) from Rate ( $\alpha$ ).

$$vf1 \text{ (mm/min)} \times \alpha = vf \text{ (mm/min)}$$

Feed for actual machining

Example

Machining S50C with MSE430  $\phi 1$

Recommended milling condition

Spindle Speed  $n$ ; 20,700 min<sup>-1</sup>

Feed  $vf$ ; 330 mm/min

In case Maximum Spindle Speed of the machine is 10,000min<sup>-1</sup>...

Feed for Spindle Speed 10,000min<sup>-1</sup>

10,000 ÷ 20,700 = 0.483 (Rate)

330 × 0.483 = 159mm/min

Feed  $vf$  ; 159 mm/min

## Cutting Speed (vc) (m/min)

Appropriate Cutting Speed should be decided by parameters such as tool material, diameter, length of cut, work material, cutting machine, rigidity of tool holder, machining configuration, accuracy, cutting fluid, and etc.  
Generally tool material and work material are main factors to determine the Cutting Speed.

Table 1.  
Cutting Speed

| Work Material                                     | Cutting Speed (m/min) |                     |
|---------------------------------------------------|-----------------------|---------------------|
|                                                   | Solid Carbide Tool    | Coated Carbide Tool |
| Carbon Steels<br>e.g.)S50C                        | 30 ~ 60               | 60 ~ 150            |
| Alloy Steels<br>e.g.)SCM, SKD                     | 30 ~ 40               | 60 ~ 100            |
| Prehardened Steels<br>e.g.)NAK, HPM               | 30 ~ 40               | 60 ~ 100            |
| Stainless Steels<br>e.g.)SUS304                   | 20 ~ 30               | 40 ~ 80             |
| Hardened Steels(45 ~ 60HRC)<br>e.g.)SKD61, STAVAX | —                     | 20 ~ 100            |

## Feed per Tooth (fz) (mm/tooth)

Feed per Tooth is an important element for efficient machining which should be determined by parameters such as tool diameter, type, work material, cutting machine, rigidity of tool holder, machining configuration, accuracy and cutting depth.  
Table 2 is a guideline of Feed per Tooth for short flute end mills.

Table 2.  
Feed per Tooth

| Dia. (mm) | Feed per Tooth (mm/tooth) |             |
|-----------|---------------------------|-------------|
|           | 2-Flutes                  | 4-Flutes    |
| 1         | 0.001 ~ 0.005             |             |
| 6         | 0.02 ~ 0.04               | 0.01 ~ 0.03 |
| 10        | 0.04 ~ 0.08               | 0.03 ~ 0.06 |
| 20        | 0.08 ~ 0.12               | 0.06 ~ 0.1  |

※ Note: Feed per Tooth for standard flute size end mills should be adjusted to 80% or less from table 2.

Referring above parameters of Cutting Speed and Feed per Tooth, both Spindle Speed and Feed are calculated considering all other related factors as well.

# Cutting conditions of End Mill (2)

## Metal Removal Rate (cm<sup>3</sup>/min)

Metal removal rate (the volume of metal removed in cubic mm per minute) is calculated by the following formula.

$$Q_{(\text{cm}^3/\text{min})} = \frac{a_p \times a_e \times v_f}{1,000}$$

$Q$  : Metal removal rate (cm<sup>3</sup>/min)

$a_p$  : Axial depth of cut (mm)  
 $a_e$  : Radial depth of cut (mm)  
 $v_f$  : Feed (mm/min)

## all end mill and pick feed (ae) (theoretical surface finish)

In ball end mill milling, height  $h$  of the unmachined part like mountain shape below be formed by ball radius and pick feed, which are called cusp height or scallop height and which is considered theoretical surface finish. Since pick feed is the same  $a_e$  radial depth of cut at the milling in flat part, it is calculated by the following formula.

$$h_{(\mu\text{m})} = \left( R - \sqrt{R^2 - \left(\frac{ae}{2}\right)^2} \right) \times 1000 \approx ae^2 \times 1000 \div 8R$$

$R$  : Radius (mm)  
 $ae$  : Radial depth of cut (mm)

| Cusp Height Quick Reference Matrix |                             |        |      |      |      |      |      |      |      |      |      |
|------------------------------------|-----------------------------|--------|------|------|------|------|------|------|------|------|------|
| Radius                             | Radial depth of cut ae [mm] |        |      |      |      |      |      |      |      |      |      |
|                                    | 0.005                       | 0.01   | 0.02 | 0.03 | 0.04 | 0.05 | 0.08 | 0.1  | 0.15 | 0.2  | 0.3  |
| 0.05                               | 0.06                        | 0.25   | 1.01 | 2.30 | —    | —    | —    | —    | —    | —    | —    |
| 0.1                                | 0.03                        | 0.13   | 0.50 | 1.13 | 2.02 | 3.18 | —    | —    | —    | —    | —    |
| 0.3                                | 0.01                        | 0.04   | 0.17 | 0.38 | 0.67 | 1.04 | 2.68 | 4.20 | —    | —    | —    |
| 0.5                                | ~ 0.01                      | 0.03   | 0.10 | 0.23 | 0.40 | 0.63 | 1.60 | 2.51 | 5.66 | —    | —    |
| 0.75                               | —                           | 0.02   | 0.07 | 0.15 | 0.27 | 0.42 | 1.07 | 1.67 | 3.76 | 6.70 | —    |
| 1                                  | —                           | 0.01   | 0.05 | 0.11 | 0.20 | 0.31 | 0.80 | 1.25 | 2.82 | 5.01 | —    |
| 1.5                                | —                           | ~ 0.01 | 0.03 | 0.08 | 0.13 | 0.21 | 0.53 | 0.83 | 1.88 | 3.34 | 7.52 |
| 2                                  | —                           | —      | 0.03 | 0.06 | 0.10 | 0.16 | 0.40 | 0.63 | 1.41 | 2.50 | 5.63 |
| 2.5                                | —                           | —      | 0.02 | 0.05 | 0.08 | 0.13 | 0.32 | 0.50 | 1.13 | 2.00 | 4.50 |
| 3                                  | —                           | —      | 0.02 | 0.04 | 0.07 | 0.10 | 0.27 | 0.42 | 0.94 | 1.67 | 3.75 |

※In finishing in flat part, the above values in the table are theoretical values by the radial depth of cut (ae).

## Selection of Number of Flute

|              | 2-Flutes | 3-Flutes | 4-Flutes | 6-Flutes |
|--------------|----------|----------|----------|----------|
| Slotting     | ○        | ⊙        | ○        | ×        |
| Side Milling | ○        | ⊙        | ⊙        | ⊙        |

Generally 2-flutes and 3-flutes are selected for slotting because of the larger chip pocket. 4-flutes and 6-flutes are recommended for side milling as no problem of chip disposal.

## Selection of Helix Angle

|                    |                 | Helix 25° | Helix 30° | Helix 35° | Helix 40° | Helix 45° |
|--------------------|-----------------|-----------|-----------|-----------|-----------|-----------|
| Shearing ability   |                 | ○         | ○         | ⊙         | ⊙         | ⊙         |
| Chatter resistance |                 | ○         | ○         | ⊙         | ⊙         | ⊙         |
| Surface roughness  |                 | ○         | ○         | ⊙         | ⊙         | ⊙         |
| Inclination        |                 | ⊙         | ⊙         | ⊙         | ○         | ○         |
| Wave               |                 | ⊙         | ⊙         | ⊙         | ○         | ○         |
| Application        | Slotting        | ⊙         | ⊙         | ○         | ○         | △         |
|                    | Side milling    | ○         | ⊙         | ⊙         | ⊙         | ⊙         |
|                    | Hardened steels | △         | △         | ○         | ⊙         | ⊙         |

※ Remarks

- Helix 25°  
Suitable for slotting.
- Helix 30°  
Recommendable for both slotting and side milling.
- Helix 35°, Helix 40°, Helix 45°  
Selectable within the required tolerance.  
As larger angle gives higher shearing ability and reduce chattering, it is possible to relatively prolong the length of cut.
- Helix 45°  
Suitable for machining for hardened steels and tough materials.

## Cutting Direction (Up-cut and Down-cut)

Cutting structure of Up-cut and Down-cut

Difference of edge wear by cutting directions

Down-cut tooth first cuts thicker then progressively thinner, while Up-cut goes the opposite. As shown by above photos, Down-cut is recommended since the wear of cutting edge is comparatively small and tool life is eventually longer.

# Summary of diameter of cutting point of Ball End Mill

| (R)    | (D)  | Axial Depth of Cut (ap) 【mm】 |       |       |       |       |       |      |      |      |      |      |      |      |       |       |

# Measurement and Symbol of Surface Roughness (Extracted from JIS B 0601-2001)

| Type                                     | Symbol | Description                                                                                                                                                                                                                                             | Reference chart                                                                             |
|------------------------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| Maximum Height of the Profile            | Rz     | The maximum height of the profile is the distance between the maximum peak height and the maximum valley depth from the mean line in each sampling length. Rz(ISO/JIS)is the mean value of the maximum peak-to-valley heights in the evaluation length. | <p><math>Rz = R_p + R_v</math></p>                                                          |
| Arithmetic Mean Deviation of the Profile | Ra     | The arithmetic mean deviation of the profile is the arithmetic mean of the absolute values of distances from the mean line to the profile.                                                                                                              | <p><math>Ra = \frac{1}{L} \int_0^L  f(x)  dx</math></p> <p><b>L</b> = Evaluation Length</p> |

Factors for End Mill Operation

| Factor                                                                                                                      | Instruction and Advice                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rigidity of Machine                      | ① Use a rigid machine.<br>② Adjust cutting conditions according to the rigidity of machine.                                                                                                                  |
| Collet Chuck and Run out of End Mill     | ① Use a rigid and precise collet chuck.<br>② Minimize the run out of end mill.                                                                                                                               |
| Work Clamp                               | ① Work piece must be firmly clamped.<br>② In case work piece cannot be firmly clamped, relieve cutting condition.                                                                                            |
| Cutting Fluid and Chips                 | ① Give a sufficient cutting fluid.<br>② Recommend water soluble fluid for heavy cutting.<br>③ Some end mills apply dry cutting only.<br>④ Use air blow for dry cutting.<br>⑤ Remove chips from working area. |
| Selection of End Mill                  | ① Select most suitable end mills according to work material and dimension.<br>② Refer to the index table on front page.                                                                                      |
| Cutting Conditions<br><b>vc vf ap ae</b>                                                                                    | ① Refer to recommended milling condition table.<br>② It is necessary to adjust conditions according to the machine rigidity and clamping condition of work material.                                         |
| Overhang of End Mill from Tool Holder  | ① Overhang of end mill must be as short as possible from tool holder.<br>② In case overhang cannot be shorten, relieve cutting condition.                                                                    |

Read Following Precautions for Safe Use

Attention on Safety

- When removing tools from cases, be careful of getting-out of tools and don't touch directly the cutting edges.
- Never touch the cutting edges directly with bare hand.
- Use safety covers and eye protection, as tools may be broken.
- Use holders, etc. that match the tools and nature of the machining operations. The tool should be firmly attached to the holder to prevent shaking.
- The work materials clamp firmly.
- Make sure of dimensions of tools and work pieces before starting operation.
- It is necessary to adjust conditions according to the dimensions of work materials and the machine.
- Select a cutting fluid appropriate to the particular usage. Using water-insoluble fluid could lead to fires due to sparks generated during machining or heat caused by breakage. Ensure that you take proper fire-prevention measures.
- If abnormal sound, etc. occurs during machining, stop the machine immediately.
- Don't modify tools.

Attention on Regridding

- When the tool is reground, grinding dust is generated which is dangerous to your health. Be sure to wear protective glasses and a dust proof mask.
- Regrind tools at proper period.

Technical Guidance

NS TOOL CO., LTD.

6F Sumitomofudosan-ooimachiekimae  
1-28-1, Oi, Shinagawa-ku, Tokyo 140-0014 Japan
