ENDMILL CATALOG  
Vol.19 2022.03—

# Particular about quality in Monozukuri

## For Crafting Tomorrow

In any time of period, we have always been proud to support Japan's *monozukuri* (manufacturing) and the commitment has been our basis since foundation.

As a leading company specialized in small-diameter cemented carbide end mills, NS TOOL manufactures high value-added products by responding to needs and expectations of customers and society.

NS TOOL strives constantly to enhance its own technological standards and create cutting-edge solutions.

Wishing for delivering unseen innovation in technology, quality and service for the future and the world, we, NS TOOL, will open up the infinite dreams and possibilities of *monozukuri*.

## NS TOOL embody innovation

Shape the exciting dreams and inspirations of companies and engineers.

NS TOOL creat end mills that produce unprecedented "molds" and "parts", and will support the next innovation.

For Crafting Creation

NS TOOL  
OUR COMMITMENT

The future is ...

For Crafting Medical

For Crafting Environment

For Crafting Memory

For Crafting Victory

Be a TOOL for our future

How to use NS catalog

Main Series Classification

There are four major categories, end mill, drill, thread mill, and chamfering

Furthermore, end mill from many models, are classified as "CBN and PCD end mill"

"Ultra-micro size end mill"

"Regular line with wide variation"

and "end mill designed according to work material"

| Identified color | Name of Series                | Features of Series                                                                                                      |
|------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------|
|                  | CBN Core Line                 | Various lineup optimize a long time machining on hardened steel                                                         |
|                  | PCD Core Line                 | Achieves nano-level surface roughness like a mirror surface by milling                                                  |
|                  | Micro Edge                    | Various lineup for micro manufacturing                                                                                  |
|                  | Regular Line                  | MUGEN COATING PREMIUM Plus<br>Optimized for machining hardened steel up to 55 to 70HRC                                  |
|                  |                               | MUGEN COATING PREMIUM<br>Suitable for machining on 50~65HRC hardened steels, stainless steels and heat resistant alloys |
|                  |                               | MUGEN COATING<br>Abundant variations support machining on different work materials                                      |
|                  | Tapered                       | End mills enables tapered machining                                                                                     |
|                  | High Efficient Milling        | End mills lineup to realize high efficient machining                                                                    |
|                  | Aluminium Milling             | Sharp cutting to realize high speed machining without chattering                                                        |
|                  | Copper Electrode Milling      | Realized overwhelming long tool life and high quality burrless cutting performance                                      |
|                  | Resin Milling                 | High machinability sharp cutting edge suppresses burrs and enables good finished surface                                |
|                  | Hard Brittle Material Milling | Diamond coating realizes direct milling even on hard brittle materials                                                  |
|                  | Graphite Milling              | Long time machining and high durability are achieved on graphite machining                                              |

Drill

Standard lineup from  $\phi 0.01$

Thread mill

Fine thread milling is realized on different kind of work materials

Chamfering

Chamfering cutter enables R chamfering and C chamfering

Machinable hardness

**NX-25**

LEAD 25 End Mill

Size  $\phi 0.5 \sim \phi 12$

MG  $\leq 40$  HRC

Material

Number of Flute

Helix Angle

Sharp Edge

R Tolerance

Shank Tolerance

Side milling...Side

Slotting...Slot

Face milling...Face

Plunging...Plunge

3D milling...3D

● L/D=1 and helix angle 25°. Low helix angle minimize the milling deflection of work piece.

Work Material
Unit : mm

## Common notes for all products

|                              |                                                                                                                                                                             |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Explanation                  | Recommended cutting conditions indicate just for reference.<br>It should be adjusted according to milling shape and machine tool.                                           |
| Preparation                  | Tool measurement required. In order to avoid interference to the work material.                                                                                             |
|                              | Recommend to assess the machine characters, such as expansion of the spindle and others before using the tool.                                                              |
|                              | Down-cut is recommended.                                                                                                                                                    |
|                              | Minimize chucking runout. (Recommend to measure actual runout at activated spindle speed.)                                                                                  |
|                              | Use a rigid machine and holder.                                                                                                                                             |
|                              | Extra care of handling when tool setting and measuring.                                                                                                                     |
|                              | Minimize a possible tool overhang length.                                                                                                                                   |
|                              | Select a cutting fluid appropriate to work material, milling shape and machining content.                                                                                   |
| Milling condition adjustment | When cutting high load sections or complex shapes, it requires attention to condition setting and tool path.                                                                |
|                              | Reduce the feed for high accurate machining to avoid breakage of work piece.                                                                                                |
|                              | Reduce both spindle speed and feed at same rate for chattering, and also for insufficient spindle speed of a machine.                                                       |
|                              | Adjust milling condition conforming with machine rigidity and clamping condition.<br>Final milling conditions are subject to machining profile, purpose and machine status. |
|                              | Spindle speed and feed are changed according to overhang length and depth of cut.                                                                                           |
|                              | For finishing process, please adjust to the optimized condition to meet the requirement of machining accuracy.                                                              |
|                              | Care for chip removal to avoid being stuck or caught during process for better surface quality.                                                                             |

New Products

New

MUGEN COATING PREMIUM Plus High Efficient 3-Flute Small-Diameter Long Neck Ball End Mill for Hardened Steel

MRBSH330

R0.1~R1    Total 22 Sizes

● High efficiency 3-flute ball end mill optimizes shape of ball center and enables high depth of cut and high feed machining

Size Expansion

Long Neck Square End Mill for Copper Electrode

DHR237

φ0.1~φ6    Total 74 Sizes

● Long neck square end mill specialized for machining copper alloy. Sharpe cutting edge makes less burr and high quality surface

Size Expansion

Long Neck Ball End Mill for Copper Electrode

DRB230

R0.05~R3    Total 94 Sizes

● Long neck ball end mill specialized for machining copper alloy. Sharpe cutting edge makes less burr and high quality surface

Size Expansion

Long Neck Radius End Mill for Copper Electrode

DHR237R

φ0.2×R0.02~φ6×R1    Total 153 Sizes

● Long neck corner radius end mill specialized for machining copper alloy. Sharpe cutting edge makes less burr and high quality surface

New

CBN Super High Precision Radius End Mill

SHPR400

φ0.1×R0.01~φ3×R0.2    Total 142 Sizes

● 4-flute corner radius end mill from Dia.0.1mm. High precise type to pursue machining accuracy

New

MUGEN COATING PREMIUM Plus 3-Flute Ball End Mill for 5-axis machining

MSBSH330-5X

R0.1~R1    Total 8 Sizes

● 3-Flute high rigidity ball design conforms features of 5-axis machine to reduce total manufacturing cost with high precision and high efficiency machining

New

MUGEN COATING PREMIUM Plus 2-Flute Long Neck Ball End Mill with Short Shank for Hardened Steel and High accuracy cutting

MRBSH230SF

R0.05~R3    Total 83 Sizes

● High precision and long tool life even in hardened steels up to 70HRC

Size Expansion

MUGEN COATING Flat Drill

MFD

φ0.1~φ6    Total 69 Sizes

● Stable drilling is realized in various scenes such as inclined surface and curved surface

**Size Expansion** MUGEN COATING PREMIUM 4-Flute Long Neck Radius End Mill for Hardened Steel

## MHRH430R

**$\phi 0.1 \times R0.01 \sim \phi 6 \times R1$**  Total 336 Sizes

● 4-flute long neck corner radius end mill for prehardened steels and hardened steels(  $\sim 65\text{HRC}$ ). Maximum L/D=16

Page ▶ G-044

**New** MUGEN COATING PREMIUM 4-Flute High Efficient "Z" End Mill for Stainless Steels

## MSUSZ440

**$\phi 1 \sim \phi 6$**  Total 62 Sizes

● For machining on stainless steels and heat resistant alloy. Continuous machining from drilling to slotting  
Unequal flute spacing and unequal helix angle design

Page ▶ K-004

**New** MUGEN COATING PREMIUM 4-Flute Long Neck High Efficient "Z" End Mill for Stainless Steels

## MSUSZ440-LN

**$\phi 1 \sim \phi 6$**  Total 33 Sizes

● For machining on stainless steels and heat resistant alloy. Continuous machining from drilling to slotting  
Unequal flute spacing and unequal helix angle design

Page ▶ K-014

**New** MUGEN COATING 4-Flute High Efficient "Z" End Mill for Carbon Steels

## MSCZ440

**$\phi 1 \sim \phi 6$**  Total 62 Sizes

● High efficient machining on carbon steels. Continuous machining from plunging approach to slotting

Page ▶ K-006

**New** MUGEN COATING 4-Flute Long Neck High Efficient "Z" End Mill for Carbon Steels

## MSCZ440-LN

**$\phi 1 \sim \phi 6$**  Total 33 Sizes

● High efficient machining on carbon steels. Continuous machining from plunging approach to slotting.  
Long neck type to prevent interference

Page ▶ K-016

**Size Expansion** MUGEN COATING PREMIUM 2-Flute Long Taper Neck Ball End Mill

## MRBTNH230

**$R0.05 \times \text{Neck taper angle } 3^\circ \sim R2 \times \text{Neck taper angle } 1^\circ$**  Total 209 Sizes

● Taper neck to improve tool rigidity. Option of same taper angle as inclined working angle

Page ▶ G-028

**Size Expansion** MUGEN COATING 2-Flute Radius End Mill

## MSRS230

**$\phi 1 \times R0.1 \sim \phi 6 \times R2$**  Total 38 Sizes

● 2-flute standard type corner radius end mill with helix angle  $30^\circ$ . For multi-purpose from roughing to finishing

Page ▶ H-074

**Size Expansion** MUGEN COATING 4-Flute Radius End Mill

## MSRS430

**$\phi 1 \times R0.1 \sim \phi 12 \times R3$**  Total 64 Sizes

● 4-flute standard type corner radius end mill with helix angle  $30^\circ$ . For multi-purpose from roughing to finishing

CBN micro end mill with standardized of Dia.0.1mm or smaller

**PATENTED** PAT. No. 5177982

- NS TOOL engineering technology and selected CBN material realize sharp edge.
- Tolerance of flute diameter is  $\pm 2\mu\text{m}$ .
- Tolerance of shank diameter is h3 (0~-0.0025).

How to Order

When you order, indicate SMEZ120 (D). ※( $\gamma$ ) is reference value.

Points in Use

Advice on Cutting Environment

- ④ Minimize the deflection of cutting edge.
- ④ To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- ④ When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- ④ When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

CBN Square End Mill

Recommended Milling Conditions

Best applicable for precise machining on minute corners of the narrow pitch connectors and etc

- Possible to machine the corner edge of hardened steels.
- Intensified wear resistance by NS TOOL original design of cutting edge.

| Notes         |                   | ※1 Depth of Cut is the maximum effective value for the contour line tool path.<br>※2 ap: Axial Depth of Cut, ae: Radial Depth of Cut.<br>※3 Recommended oil mist coolant.<br>※4 Minimize a possible tool overhang length.<br>※5 Minimize chucking runout. (Recommend to measure actual runout of activated spindle speed.)<br>※6 For the reference value, when finishing process of bottom surface, reduce the feed approx. 50% of the recommended milling conditions and Depth of Cut (ap): 0.001mm for Dia. 0.1mm, (ae): Dia. x 0.05mm. |       |        |                   |                                      |       |        |                   |                                      |       |        |                   |

Points in Use

Advice on Cutting Environment

- ⚙ Minimize the deflection of cutting edge.
- ⚙ To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- ⚙ When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- ⚙ When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

Unit : mm

How to Order

When you order, indicate SSE400 (D)x( $\phi$ 1).    ※( $\gamma$ ) is reference value.

CBN Square End Mill

Recommended Milling Conditions

Best applicable for precise machining on minute corners of the narrow pitch connectors and etc

- Possible to machine the corner edge of hardened steels.
- Intensified wear resistance by NS TOOL original design of cutting edge.

Cutting edge shape

| Notes         |                   | ※1 Depth of Cut is the maximum effective value for the contour line tool path.<br>※2 ap: Axial Depth of Cut, ae: Radial Depth of Cut.<br>※3 Recommended oil mist coolant.<br>※4 Minimize a possible tool overhang length.<br>※5 Minimize chucking runout. (Recommend to measure actual runout of activated spindle speed.)<br>※6 For the reference value, when finishing process of bottom surface, reduce the feed approx. 50% of the recommended milling conditions and Depth of Cut (ap): 0.002mm for Dia. 0.2mm and 0.3mm, for Dia. 0.4 to 1mm, up to 0.003mm, (ae): Dia. x 0.05mm. |       |        |                   |                                      |       |        |                   |                                      |       |        |                   |

Points in Use

Advice on Cutting Environment

- Minimize the deflection of cutting edge.
- To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

CBN Ball End Mill for precision machining “CBN Micro Ball” ※ Listed at “Micro Edge” as well (Page D-010)

Recommended Milling Conditions

Realized micro milling by size line up R0.01 - R0.05

- The world's first CBN Micro Ball End Mill.
- CBN Micro Ball develops new machining capability in high-precision technology.
- Standarized sizes from R0.01.
- Long machining on pre-hardened to high-hardened steels.

Machining case W-003

CBN Super Finish Ball End Mill

Recommended Milling Conditions

Realized nano level surface roughness even for milling with its R-center

**PATENTED** PAT. No. 3759098

- Sharpened edge at R-center improves shearing ability.
- Continuous 10 hours machining on hardened steel of 60HRC.
- Long-lasting high surface accuracy Rz1.0μm.
- Save significant time at polishing process.

Cutting edge shape

Sharp tooth edge guarantees long and consistent accuracy.

Work size : 20x20mm

Points in Use

Advice on Cutting Environment

- Minimize the deflection of cutting edge.
- To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

Long Neck  
Ball

Long Neck  
Ball

CBN Super Spiral Ball End Mill

Recommended Milling Conditions

Realized glossy finished surface

- Adopted spiral ball shape to improve sharpness of cutting edge.
- Adopted cutting edge shape to improve the chipping resistance of cutting edge.
- When peripheral cutting edge makes contact with cutting surface, vibration occurs by an increase in cutting resistance and it affects tool life and cutting surface quality. The influence can be reduced by adoption of the strong back taper shape.
- Enlarged standard tool size up to R3 to extend application range.

Cutting edge shape

Unit : mm

| Notes         |                   | ※1 Max. Depth of Cut for semi-finishing and finishing. Adjust milling conditions depending on the rigidity of the machine and desired accuracy.<br>※2 Obtain uniform stock amount on the cutting surface in the pre-stage cutting (semi-finishing).<br>※3 Required careful set up of milling conditions, tool path and etc. at cutting parts, such as corners where will become overloaded.<br>※4 Adjust both Depth of Cut and feed rate at 70% of the recommended milling conditions for high quality milling surface.<br>※5 Oil mist coolant is recommended.<br>※6 Adjust feed rate at same rate as spindle speed if necessary to adjust spindle speed from recommended milling conditions. |       |        |                   |                                            |       |        |                   |                                          |       |        |                   |

Points in Use

Advice on Cutting Environment

- Minimize the deflection of cutting edge.
- To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

CBN Super Speed Ball End Mill

Recommended Milling Conditions

Capable to machine with the same depth of cut as carbide tool finishing

- This CBN Ball End Mill has realized both advantages of CBN and Carbide.
- Depth of Cut can be increased at the equivalent level to Carbide.
- Unique flute design with R-accuracy ±0.003 prevents chipping!
- Flute is smoothly tangent from straight line to R-curve.
- Applicable for hardened materials up to 70HRC!

Cutting edge shape

How to Order

When you order, indicate SSB200 (R)×(ℓ1). ※(γ) is reference value.

Machining case

W-005

Points in Use

Advice on Cutting Environment

- ➊ Minimize the deflection of cutting edge.
- ➋ To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- ➊ When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- ➋ When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

CBN Super Spiral Long Neck Ball End Mill

Recommended Milling Conditions

Realized glossy finished surface by maximum L/D=10

- Added longer under neck length type to SSPB220 series.
- Realized deeper milling by adoption of spiral ball shape and strong back taper shape to improve both sharpness and the chipping resistance of cutting edges.

Cutting edge shape

| Notes         |                   | ※1 Max. Depth of Cut for semi-finishing and finishing. Adjust milling conditions depending on the rigidity of the machine and desired accuracy.<br>※2 Obtain uniform stock amount on the cutting surface in the pre-stage cutting (semi-finishing).<br>※3 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※4 Required careful set up of milling conditions, tool path and etc. at cutting parts, such as corners where will become overloaded.<br>※5 Coolant supply and chip disposal in the deep portion are very important.<br>※6 Oil mist coolant is recommended. |       |        |                   |                                            |       |        |                   |                                          |       |        |                   |

Points in Use

Advice on Cutting Environment

- Minimize the deflection of cutting edge.
- To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

## CBN Super Speed Long Neck Ball End Mill

## Recommended Milling Conditions

Capable to machine at deep area finishing by maximum L/D=10

- Lineup of CBN tool with long neck applicable to deep milling, available 25 sizes in total.
- Enables milling more deeply by long under neck length up to 10mm.
- Enables wider application for milling by long neck in addition to long life and accurate finishing.
- Standardized in R0.05 at smallest.
- Unique flute design with R-accuracy ±0.003 prevents chipping!

Cutting edge shape

| Notes         |                   |     | <p>※1 Depth of Cut shows the maximum value for semi-finishing and finishing.<br/>※2 Depth of Cut : ap = Axial Depth of Cut / ae = Radial Depth of Cut.<br/>※3 We recommend using oil mist coolant.<br/>※4 Adjust both spindle speed and feed at the same rate.<br/>※5 Adjust milling conditions according to the volume of Depth of Cut and rigidity of machine.<br/>※6 Length of tool overhang must be as short as possible.</p> <p>※7 Recommended milling conditions for the sizes L/D (Effective length / Diameter) = 5 or longer are based on machining inclined angle 30 deg. or lower.</p> |       |        |                   |                                      |       |        |                   |                                      |       |        |                   |

## Points in Use

### Advice on Cutting Environment

- Minimize the deflection of cutting edge.
- To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

### Advice on Finishing Allowance (stock amount)

- When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

## CBN Super Spiral Long Taper Neck Ball End Mill

## CBN Super Spiral Long Taper Neck Ball End Mill

Taper neck design for high rigidity.  
Suitable for deep and high accurate finishing

- To realize more rigid, CBN long neck ball end mill with taper neck are adopted.
- Both efficiency and accuracy are increasing by taper neck design and spiral ball shape with improved sharpness in finish machining on deep milling.

Cutting edge shape

### General Taper Neck Design

| Notes         |                  |                   | ※1 Max. Depth of Cut for semi-finishing and finishing. Adjust milling conditions depending on the rigidity of the machine and desired accuracy.<br>※2 Obtain uniform stock amount on the cutting surface in the pre-stage cutting (semi-finishing).<br>※3 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※4 Required careful set up of milling conditions, tool path and etc. at cutting parts, such as corners where will become overloaded.<br>※5 Coolant supply and chip disposal in the deep portion are very important.<br>※6 Oil mist coolant is recommended. |       |        |                   |                                            |       |        |                   |                                          |       |        |                   |

### Points in Use

Advice on Cutting Environment

Minimize the deflection of cutting edge.

To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**

When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy.**Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

CBN Super Speed Radius End Mill

CBN Super Speed Radius End Mill

Corner radius end mill with CBN material at the cutting edge.  
Total 172 sizes. Applicable for various machining profiles

- Realized high efficient machining with radius flute along with excellent wear resistance of CBN.
- Realized excellent surface roughness by introducing smooth tangent on all over flute.
- Applicable for work materials from tempered steel to hardened steel (up to 70 HRC).
- Lineup from Dia.0.1mm. 172 sizes in total.

Advice on Cutting Environment

Minimize the deflection of cutting edge.

To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**

When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy.**Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

Top of work material

Surface for semi-finishing

Surface for finishing

No uniformity at corner area

| Notes         |                 | ※1 Depth of Cut shows the maximum value for semi-finishing and finishing. Adjust milling conditions depending on the rigidity of the machine and desired accuracy.<br>※2 Depth of Cut : ap = Axial Depth of Cut / ae = Radial Depth of Cut.<br>※3 Recommend to apply helical or ramping for approaching into axial direction.<br>※4 We recommend using oil mist coolant.<br>※5 Adjust both spindle speed and feed at the same rate.<br>※6 Adjust milling conditions according to the volume of Depth of Cut and rigidity of machine.<br>※7 Length of tool overhang must be as short as possible.<br>※8 Machine, tool chuck must be sufficiently accurate. |                                                                      |       |        |                   |                                                 |       |        |                   |                                            |       |        |                   |

3-flute CBN corner radius end mill.  
Realized high efficient and high accurate machining

- Realized high accuracy and high efficiency machining by adopting 3 flutes and corner R with spiral shape.

Cutting edge shape

CBN Super High Precision Radius End Mill

CBN Super High Precision Radius End Mill

4-flute corner radius end mill from Dia.0.1mm.  
High precise type to pursue machining accuracy

Prehardened Steel P

- New tool design has been developed to reduce the cutting resistance and upgrade the finishing accuracy!
- Realized 4-Flute type from  $\phi 0.1$ ! Achieved higher efficient machining and more stable tool life in micro machining!
- The shank diameter accuracy is  $2\mu\text{m}$  ( $-0.001 \sim -0.003$ ), and also supports high precision shrink fit holders.
- Line up from  $\phi 0.1 \sim \phi 3$ , total 142 sizes.

Cutting edge shape

Beware of stocks because there is no blade to the shaft center of endteeth of  $\phi 0.1$  and  $\phi 0.15$ .

| Notes         |               |                   |      | ※1 Depth of Cut shows maximum value for semi-finishing and finishing. Adjust milling conditions depending on rigidity of machine, desired accuracy and milling shape.<br>※2 Depth of Cut : ap = Axial Depth of Cut / ae = Radial Depth of Cut.<br>※3 To achieve better cutting surface, obtain uniform stock amount on cutting surface in semi-finishing.<br>※4 When machining at high load area, such as corners, please pay attention to set cutting condition and tool paths.<br>※5 Recommend to apply helical or ramping for approaching into axial direction.<br>※6 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※7 We recommend using oil mist coolant. |        |        |                   |                                            |        |              |        |                                          |                   |              |        |               |       |

CBN Super Surface End Mill

Recommended Milling Conditions

Single flute end mill for hardened steels  
Specialized for accurate finishing on flat surface

- Appropriate for datum plane machining on precision machining.
- NS original design and corner R to realize stable machining surface.

Cutting edge shape

How to Order

When you order, indicate SSF120 (D). ※(γ) is reference value.

Points in Use

Advice on Cutting Environment

- ① Minimize the deflection of cutting edge.
- ② To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- ① When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- ② When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

Machining Case 1

Work Material DC53(SKD11) 60HRC Tool SSF120  $\phi 0.5$

Surface roughness: Rz16.3nm

(1nm = 0.001μm)

Conditions (Finishing process)

|                |                          |
|----------------|--------------------------|
| Spindle speed  | 120,000min <sup>-1</sup> |
| Feed           | 300mm/min                |
| Depth of cut   | 2μm×5μm (ap×ae)          |
| Coolant        | Oil mist                 |
| Machining time | 30min                    |

Machining Case 2

Work Material DC53(SKD11) 60HRC

Tool  
SSF120  $\phi 0.8$

Work size  
10×6×2mm

Surface roughness: Rz70nm

(1nm = 0.001μm)

Conditions (Finishing process)

|                | Bottom face milling     | Side face milling |
|----------------|-------------------------|-------------------|
| Spindle speed  | 35,000min <sup>-1</sup> |                   |
| Feed           | 150mm/min               |                   |
| Depth of cut   | 3μm×8μm (ap×ae)         | 10μm×10μm (ap×ae) |
| Coolant        | Oil mist                |                   |
| Machining time | 1hr 30min               |                   |

PCD Square End Mill

Recommended Milling Conditions

PCD square end mill. Realized nano level finished surface roughness on hard brittle materials

- Fine and stable milling surface realized on cemented carbide material.
- Possible to get the nano-level surface roughness required on ultra-high precision machining.
- NS original flute design of cutting edge enabled a strong resistance against wear and chipping.

Cutting edge shape 2-Flute

Cutting edge shape 6-Flute

Actual diameter is indicated in 1 micron units on product label, and enables high precision machining.  
※Micron units dimensions cannot be specified.

PCD Ball End Mill

Recommended Milling Conditions

Capable to machine nano level surface roughness, and mirror finishing

- Unique tool geometry makes stable surface.
- Polish-less machining become reality by nano-level roughness on profiling finish.
- Upgraded tool edge design makes stable high quality surface.

Actual diameter is indicated in 1 micron units on product label, and enables high precision machining.  
※Micron units dimensions cannot be specified.

- PCDRB can realize mirror like finishing on full surface machining and achieve the sub-micro level surface roughness, even for approx. 39hrs finishing process.
- Before finishing, use CBN to process semi-finishing. Leaving constant stock amount on semi-finished surface will have great affects in the finishing process.

PCD Radius End Mill

Recommended Milling Conditions

PCD corner radius end mill.  
Realized nano level finished surface roughness on hard brittle materials

- Ultimate high quality surface is realized in the corner radius shape with superior cutting performance on curved and plane surface!

Cutting edge shape 2-Flute

Cutting edge shape 4-Flute

Cutting edge shape 6-Flute

Actual diameter is indicated in 1 micron units on product label, and enables high precision machining.  
※Micron units dimensions cannot be specified.

| Notes         |               | ※1 Minimal tool runout is required to avoid the tool breakage and to increase the work accuracy.<br>※2 Due to infinitesimal Depth of Cut (a <sub>p</sub> ), recommend to assess the machine characters, such as expansion of the spindle and others before using the tool.<br>※3 Water-insoluble fluid is recommended. |        |                            |                   |

Machining Case 1

Work size :  $\phi$  15mm    Cutting depth : 0.924mm

- Work Material : Cemented Carbide 92.5HRA
- Coolant : Water-insoluble fluid
- Total machining time : 9hr 48min

CBN micro end mill with standardized of Dia.0.1mm or smaller

**PATENTED** PAT. No. 5177982

- NS engineering technology and selected CBN material realize sharp edge.
- Tolerance of flute diameter is  $\pm 2\mu\text{m}$ .
- Tolerance of shank diameter is h3 (0~0.0025).

Cutting edge shape

Unit : mm

Points in Use

Advice on Cutting Environment

- Minimize the deflection of cutting edge.
- To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

- P** Alloy Steel ☐
- P** Prehardened Steel ☐
- M** Stainless Steel ☒
- N** Aluminium Alloy ☐
- N** Copper ☐
- N** Resin ☐

Smallest Dia.0.01mm  
Single straight flute end mill for ultra micro milling

- Ultra-high-precision accuracy is guaranteed with  $\pm 2\mu\text{m}$  tolerance of flute diameter and h3 tolerance of shank diameter (circularity  $0.1\mu\text{m}$ ).
- One straight flute, 5 items from 0.01 to 0.05mm diameter.

Cutting edge shape

CBN Ball End Mill for precision machining “CBN Micro Ball” ※ Listed at “CBN Core Line” as well (Page B-010)

Recommended Milling Conditions

Realized micro milling by size line up R0.01 - R0.05

- CBN Micro Ball develops new machining capability in high-precision technology.
- Standardized sizes from R0.01.
- Realized sharp edge by maximizing features of CBN.
- Long machining on pre-hardened to high-hardened steels (60HRC~).

● Full process done by one tool.

Points in Use

Advice on Cutting Environment

- Minimize the deflection of cutting edge.
- To understand the nature of the expansion of the main spindle and machine posture transformation, and take measures against them.

Advice on Finishing Allowance (stock amount)

- When using small CBN End Mill, **uniform finishing allowance (stock amount) is important.**
- When tool is used on roughing and semi-finishing and it has a big abrasion, finishing allowance (stock amount) on semi-finishing and finishing is increasing and it affects tool life and cutting accuracy. **Therefore, it is important to get uniform stock amount in the pre-stage cutting.**

Ball End Mill for precision machining “Micro Ball”

Recommended Milling Conditions

Standardized from the smallest R0.005 for ultra micro milling

1

3D

● The world’s first standardization of Ball size R0.005. Micro Ball develops new machining field in high-precision technology.

● The world’s smallest ball end mill “Micro Ball” extends precision machining field.

● NS original R design exercises fine finishing surface.

Cutting edge shape

Unit : mm

| Code No.       | Radius (R) | Length of Cut (ℓ) | Dia. (D) | Neck Taper Angle (γ) | Shank Dia. (d) | Overall Length (L) |

How to Order

When you order, indicate NSMB100 (R). ※ ( γ ) is reference value.

Work Material

Tough Pitch Copper・Aluminium Alloy

| Radius | Depth of Cut |        | Feed   | Approaching Feed | Spindle Speed     |
|--------|--------------|--------|--------|------------------|-------------------|
|        | ap mm        | ae mm  | mm/min | mm/min           | min <sup>-1</sup> |
| 0.005  | 0.0003       | 0.0005 | 5      | 2                | 60,000            |
| 0.01   | 0.0005       | 0.001  | 10     | 3                | 60,000            |
| 0.02   | 0.001        | 0.002  | 20     | 5                | 60,000            |
| 0.03   | 0.002        | 0.003  | 80     | 10               | 60,000            |
| 0.04   | 0.002        | 0.004  | 200    | 30               | 60,000            |
| 0.05   | 0.003        | 0.005  | 300    | 30               | 60,000            |

Notes

※1 Depth of Cut: ap=Axial Depth of Cut / ae=Radial Depth of Cut.

※2 Handle with care when exchanging and presetting tool.

※3 Use proper type of coolant for material and machining process.

※4 Minimize chucking runout

(Recommend to measure actual runout at activated spindle speed.)

※5 Tool approaching angle must be 3 degrees or below.

※6 Increase of Depth of Cut may cause a tool breakage, especially careful for Axial Depth of Cut.

Regular Line  
MUGEN COATING PREMIUM Plus

MUGEN COATING PREMIUM Plus 3-Flute Ball End Mill for 5-axis machining

Recommended Milling Conditions

3-flute high rigidity ball design conforms features of 5-axis machine to reduce total manufacturing cost with high precision and high efficiency machining

- 3-flute high rigidity ball design conforms features of 5-axis machine to reduce total manufacturing cost with high precision and high efficiency machining.
- Even hardened steel of 45 to 70HRC can be machining with long tool life and high efficiency.
- By adopting positive cutting edge for carbide material emphasized breakage resistance that suppresses chattering by 3-flute and unequal flute.
- R accuracy is ±0.005mm (R accuracy is based on a half value of actual diameter).
- Shank diameter tolerance , high accuracy type, is - 0.001 ~ - 0.003.

Machining case

Tool design suppressing the amount of deflection

Unequal spacing suppresses chattering even high feed rate machining

# MRBSH230SF New

Size R0.05 ~ R3

MUGEN COATING PREMIUM Plus 2-Flute Long Neck Ball End Mill  
with Short Shank for Hardened Steel and High accuracy cutting

High precision and long tool life even for hardened steels  
up to 70HRC

- Realize stable cutting performance even for 70 HRC hardened steels.
- Developed new MUGEN COATING PREMIUM Plus to upgrade oxidation resistance and abrasion resistance.
- Adopt optimized new tool material and tool design to reduce cutting load.
- R accuracy is  $\pm 0.003\text{mm}$  (R accuracy is based on a half value of actual diameter).
- Shank diameter tolerance, high accuracy type, is - 0.001mm / - 0.003mm.

| Notes         |                   |      | ※1 Depth of Cut ap indicates Axial Depth of Cut, ae indicates Radial Depth of Cut.<br>※2 In case of chattering etc., please adjust cutting conditions if necessary.<br>※3 At point where cutting load is high such as at corners, pay attention to setting cutting conditions and tool paths particularly.<br>※4 Adjust both spindle speed and feed at the same rate.<br>※5 A shrink fit type is recommended for tool holder. When using collet type or others, strictly adhere to minimum gripping length.<br>※6 We recommend using oil mist coolant. |       |       |               |                                           |       |       |               |                                           |       |       |               |

MUGEN COATING PREMIUM Plus High Efficient 3-Flute small-diameter  
Long Neck Ball End Mill for Hardened Steel

Recommended Milling Conditions

High efficiency 3-flute ball end mill optimizes shape of ball center and enables high depth of cut and high feed machining

- High-efficiency 3-flute ball end mill optimizes a shape of central edge and enables high depth of cutting.
- Even hardened steel of 45 to 70HRC can be machining with long tool life and high efficiency.
- R accuracy is ±0.005mm (R accuracy is based on a half value of actual diameter).
- Shank diameter tolerance, high accuracy type, is - 0.001 ~ - 0.003.

Unequal spacing suppresses chattering even high feed rate machining

Optimizes center edge shape, enables high depth of cut and high feed machining

Unit : mm

|               | 6-flute high helix angle corner radius end mill for prehardened steels and hardened steels up to 65HRC             |                                                   |                    |                 |             |              |              |              |            |               |             |                   |                 |                |        |       |          |                       |                          |                |        |        |                 |       |

MUGEN COATING PREMIUM 2-Flute LEAD25 End Mill

Recommended Milling Conditions

Applicable to stainless steels and titanium alloy. L/D=1. High rigidity with short length of cut. Suitable for slotting process

$D < 0.5 \quad \phi D_{-0.01}^{+0}$   
 $0.5 \leq D \leq 3 \quad \phi D_{-0.015}^{+0}$   
 $3 < D < 6 \quad \phi D_{-0.02}^{+0}$   
 $D = 6 \quad \phi D_{-0.03}^{+0.01}$

- Applicable for heat resistance alloy such as stainless steels and titanium alloy by MUGEN COATING PREMIUM.
- L/D=1 and helix 25° to increase rigidity and realize high efficient machining.
- Suppress chattering and deflection in slotting process.

Unit : mm

## Recommended Milling Conditions

Unit : mm

**How to Order** When you order, indicate MXH245 (D). ※( $\gamma$ ) is reference value.

**Square**  
**Coating**

MUGEN COATING PREMIUM 2-Flute Sharp Edge LEAD25 End Mill

Recommended Milling Conditions

Applicable to stainless steels and titanium alloy. L/D=1. Sharp edge type

$D < 0.5 \quad \phi D_{-0.01}^{+0}$   
 $0.5 \leq D \leq 3 \quad \phi D_{-0.015}^{+0}$   
 $3 < D < 6 \quad \phi D_{-0.02}^{+0}$   
 $D = 6 \quad \phi D_{-0.03}^{+0.01}$

- Applicable for heat resistance alloy such as stainless steels and titanium alloy by MUGEN COATING PREMIUM with sharp edge type.
- L/D=1 and helix 25°.

Unit : mm

When you order, indicate MXH230P (D). ※(γ) is reference value.

Square

Applicable to stainless steels and titanium alloy. L/D=3. Sharp edge type

- Applicable for heat resistance alloy such as stainless steels and titanium alloy by MUGEN COATING PREMIUM with sharp edge type.
- L/D=3 and helix 35°.

| Notes                         | ※1 Adjust milling condition conforming to machine rigidity and clamping condition.<br>※2 Use cutting fluid with smoke retardant.<br>※3 Use a rigid and precise machine and chuck holder.                                                                                       |        |                             |        |                                                                                                                                                                                                                                                                                 |        |

MUGEN COATING PREMIUM 4-Flute Square End Mill For Hardened Steel

Recommended Milling Conditions

4-flute with high helix angle. For finishing of prehardened steels and hardened steels (  $\sim 65\text{HRC}$  )

- Realized stably long tool life against high hardened steels (48 $\sim$ 65HRC).
- Improved milling deflection and accuracy by advanced flute design.

Unit : mm

MUGEN COATING PREMIUM 3-Flute Ball End Mill for Hardened Steel

Recommended Milling Conditions

3-flute high helix angle ball end mill  
for prehardened steels and hardened steels up to 65HRC

- MUGEN COATING PREMIUM realizes long tool life for machining on high-hardened steel.
- Original 3-flute design and unequal flute spacing to suppress chattering realize high efficient machining.
-  : Semi-standard item, please inquire for price and delivery.

When you order, indicate MSBH345 (R). ※ (γ) is reference value.

Machining Case 1

Binding sample

- Work material : DC53 60HRC
- Total machining time : 15hr 16min
- Coolant : Oil mist
- Work Size : 100 x 100mm (cutting depth 50mm)

MUGEN COATING PREMIUM 4-Flute Corner Radius End Mill for Hardened Steel

Recommended Milling Conditions

4-flute high helix angle corner radius end mill for prehardened steels and hardened steels up to 65HRC

- Realized stably long tool life against high hardened steels (48~65HRC).
- Corner radius to prevent flute chipping, and high helix angle for cutting sharpness.

| Notes                         | ※1 Use a rigid and precise machine and chuck holder.<br>※2 Adjust milling conditions according to the volume of Depth of Cut and rigidity of the machine.<br>※3 Adjust both spindle speed and feed at the same rate.<br>※4 Use oilmist coolant or air blow. |        |                   |        |                                                                                                                         |        |                   |        |                                                                                                                         |        |                   |        |

# MHDH645R

Size  $\phi 5 \times R0.2 \sim \phi 12 \times R2$

MUGEN COATING PREMIUM 6-Flute Corner Radius End Mill for Hardened Steel

Recommended Milling Conditions

6-flute high helix angle corner radius end mill for prehardened steels and hardened steels up to 65HRC

- Realized stably long tool life against high hardened steels (48~65HRC).
- Corner radius to prevent flute chipping, and high helix angle for cutting sharpness.

| Unit : mm      |          |                   |                   |                      |                |                    |

Long neck square end mill for hardened steels up to 65HRC.  
Maximum L/D=25

- MUGEN COATING PREMIUM to improve accuracy and tool life on machining hardened steels!
- Total 134 sizes!

How to Order

When you order, indicate MHRH230 (D)×(ℓ1). ※( γ ) is reference value.

| Notes         |                   | ※1 These recommended cutting conditions indicate just reference. It should be adjusted according to milling shape and machine type.<br>※2 ap:Axial Depth of Cut, ae:Radial Depth of Cut.<br>※3 Recommend to use oil mist coolant for machining hardened steel.<br>※4 Recommend to apply herical or ramping for approaching into axial direction.<br>※5 Adjust feed rate 50% lower and cutting depth(ae) 30% lower for milling deep wall area. When L/D exceeds 8 for stable milling.<br>※6 For slotting, recommend reciprocating milling by adjusting feed & ap in below 50% of recommended milling condition.<br>※7 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine.<br>※8 Recommend guide slotting process with short neck tool before milling with L/D 5 time or longer neck tool.<br>※9 Major adjustment of milling conditions appropriately on milling profile, machine tool and etc. required for the tools smaller than Dia. 0.5mm, or L/D 15 times longer. |        |              |       |                                                   |        |              |       |                                            |        |              |       |                                      |        |              |       |

MUGEN COATING PREMIUM 4 -Flute Long Neck End Mill for Hardened Steel

MUGEN COATING PREMIUM 4 -Flute Long Neck End Mill for Hardened Steel

4-flute long neck square end mill for prehardened steels and hardened steels up to 65HRC  
Maximum L/D=10

- MUGEN COATING PREMIUM to improve accuracy and tool life on machining hardened steels!
- Improve tool rigidity for precision machining!
- Total 55 sizes!

| Notes         |                   | ※1 These recommended cutting conditions indicate just reference. It should be adjusted according to milling shape and machine type.<br>※2 ap:Axial Depth of Cut, ae:Radial Depth of Cut.<br>※3 Recommend to use oil mist coolant for machining hardened steel.<br>※4 Recommend to apply herical or ramping for approaching into axial direction.<br>※5 Adjust feed rate 50% lower and cutting depth (ae) 30% lower for milling deep wall area. When L/D exceeds 8 for stable milling.<br>※6 For slotting, recommend reciprocating milling by adjusting feed & ap in below 50% of recommended milling condition.<br>※7 Reduce both spindle speed and feed at same rate for chattering and also for insufficient spindle speed of a machine. |        |              |       |                                                   |        |              |       |                                            |        |              |       |                                      |        |              |       |

H

Long neck ball end mill for prehardened steels and hardened steels( ~ 65HRC). Maximum L/D=22

- MUGEN COATING PREMIUM for hardened steels and unique new design excel in chipping prevention and resolves chattering to realize excellent finished surface.
- Applicable for hardened steels up to 65HRC.
- Total 224 sizes!
